

Class X

Mathematics

(CBSE 2019)

Time : 3 Hrs.

Max. Marks : 80

GENERAL INSTRUCTIONS :

- (i) All questions are compulsory.
- (ii) This question paper consists of 30 questions divided into four sections - A, B, C and D.
- (iii) Section A contains 6 questions of 1 mark each. Section B contains 6 questions of 2 marks each. Section C contains 10 questions of 3 marks each. Section D contains 8 questions of 4 marks each.
- (iv) There is no overall choice. However, an internal choice has been provided in two questions of 1 mark, two questions of 2 marks, four questions of 3 marks each and three questions of 4 marks each. You have to attempt only one of the alternatives in all such questions.
- (v) Use of calculator is not permitted.

Section-A

Question numbers 1 to 6 carry 1 mark each.

1. Find the coordinates of a point A, where AB is diameter of a circle whose centre is (2, -3) and B is the point (1, 4). [1]
2. For what values of k, the roots of the equation $x^2 + 4x + k = 0$ are real? [1]

OR

Find the value of k for which the roots of the equation $3x^2 - 10x + k = 0$ are reciprocal of each other.

3. Find A if $\tan 2A = \cot(A - 24^\circ)$ [1]

OR

Find the value of $(\sin^2 33^\circ + \sin^2 57^\circ)$

4. How many two digits numbers are divisible by 3? [1]

QB365-Question Bank Software

5. In Fig. 1, $DE \parallel BC$, $AD = 1$ cm and $BD = 2$ cm. What is the ratio of the ar($\triangle ABC$) to the ar($\triangle ADE$)? [1]

Fig. 1

6. Find a rational number between $\sqrt{2}$ and $\sqrt{3}$. [1]

Section-B

Question numbers 7 to 12 carry 2 marks each.

7. Find the HCF of 1260 and 7344 using Euclid's algorithm. [2]

OR

Show that every positive odd integer is of the form $(4q + 1)$ or $(4q + 3)$, where q is some integer.

8. Which term of the AP 3, 15, 27, 39, will be 120 more than its 21st term? [2]

OR

If S_n , the sum of first n terms of an AP is given by $S_n = 3n^2 - 4n$, find the n^{th} term.

9. Find the ratio in which the segment joining the points $(1, -3)$ and $(4, 5)$ is divided by x-axis? Also find the coordinates of this point on x-axis. [2]
10. A game consists of tossing a coin 3 times and noting the outcome each time. If getting the same result in all the tosses is a success, find the probability of losing the game. [2]
11. A die is thrown once. Find the probability of getting a number which (i) is a prime number (ii) lies between 2 and 6. [2]
12. Find c if the system of equations $cx + 3y + (3 - c) = 0$; $12x + cy - c = 0$ has infinitely many solutions? [2]

Section-C

Question numbers 13 to 22 carry 3 marks each.

13. Prove that $\sqrt{2}$ is an irrational number. [3]
14. Find the value of k such that the polynomial $x^2 - (k + 6)x + 2(2k - 1)$ has sum of its zeros equal to half of their product. [3]
15. A father's age is three times the sum of the ages of his two children. After 5 years his age will be two times the sum of their ages. Find the present age of the father. [3]

QB365-Question Bank Software

OR

A fraction becomes $\frac{1}{3}$ when 2 is subtracted from the numerator and it becomes $\frac{1}{2}$ when 1 is subtracted from the denominator. Find the fraction.

16. Find the point on y-axis which is equidistant from the points (5, -2) and (-3, 2). [3]

OR

The line segment joining the points A(2, 1) and B(5, -8) is trisected at the points P and Q such that P is nearer to A. If P also lies on the line given by $2x - y + k = 0$, find the value of k.

17. Prove that : $(\sin \theta + \operatorname{cosec} \theta)^2 + (\cos \theta + \sec \theta)^2 = 7 + \tan^2 \theta + \cot^2 \theta$. [3]

OR

Prove that : $(1 + \cot A - \operatorname{cosec} A)(1 + \tan A + \sec A) = 2$

18. In Fig. 2, PQ is a chord of length 8 cm of a circle of radius 5 cm and centre O. The tangents at P and Q intersect at point T. Find the length of TP. [3]

19. In Fig. 3, $\angle ACB = 90^\circ$ and $CD \perp AB$, prove that $CD^2 = BD \times AD$. [3]

Fig. 3

OR

If P and Q are the points on side CA and CB respectively of $\triangle ABC$, right angled at C, prove that $(AQ^2 + BP^2) = (AB^2 + PQ^2)$

20. Find the area of the shaded region in Fig. 4, if ABCD is a rectangle with sides 8 cm and 6 cm and O is the centre of circle. (Take $\pi = 3.14$) [3]

Fig. 4

QB365-Question Bank Software

21. Water in a canal, 6 m wide and 1.5 m deep, is flowing with a speed of 10 km/hour. How much area will it irrigate in 30 minutes; if 8 cm standing water is needed? [3]
22. Find the mode of the following frequency distribution. [3]

Class	0 - 10	10 - 20	20 - 30	30 - 40	40 - 50	50 - 60	60 - 70
Frequency	8	10	10	16	12	6	7

Section-D

Question numbers 23 to 30 carry 4 marks each.

23. Two water taps together can fill a tank in $1\frac{7}{8}$ hours. The tap with longer diameter takes 2 hours less than the tap with smaller one to fill the tank separately. Find the time in which each tap can fill the tank separately. [4]

OR

A boat goes 30 km upstream and 44 km downstream in 10 hours. In 13 hours, it can go 40 km upstream and 55 km downstream. Determine the speed of the stream and that of the boat in still water.

24. If the sum of first four terms of an AP is 40 and that of first 14 terms is 280. Find the sum of its first n terms. [4]

25. Prove that $\frac{\sin A - \cos A + 1}{\sin A + \cos A - 1} = \frac{1}{\sec A - \tan A}$ [4]

26. A man in a boat rowing away from a light house 100 m high takes 2 minutes to change the angle of elevation of the top of the light house from 60° to 30° . Find the speed of the boat in metres per minute. [Use $\sqrt{3} = 1.732$] [4]

OR

Two poles of equal heights are standing opposite each other on either side of the road, which is 80 m wide. From a point between them on the road, the angles of elevation of the top of the poles are 60° and 30° respectively. Find the height of the poles and the distances of the point from the poles.

27. Construct a $\triangle ABC$ in which $CA = 6$ cm, $AB = 5$ cm and $\angle BAC = 45^\circ$. Then construct a triangle whose sides are $\frac{3}{5}$ of the corresponding sides of $\triangle ABC$ [4]

28. A bucket open at the top is in the form of a frustum of a cone with a capacity of 12308.8 cm³. The radii of the top and bottom of circular ends of the bucket are 20 cm and 12 cm respectively. Find the height of the bucket and also the area of the metal sheet used in making it. (Use $\pi = 3.14$) [4]

29. Prove that in a right angle triangle, the square of the hypotenuse is equal the sum of squares of the other two sides. [4]

QB365-Question Bank Software

30. If the median of the following frequency distribution is 32.5. Find the values of f_1 and f_2 .

Class	0-10	10-20	20-30	30-40	40-50	50-60	60-70	Total
Frequency	f_1	5	9	12	f_2	3	2	40

[4]

OR

The marks obtained by 100 students of a class in an examination are given below.

Marks	No. of Students
0-5	2
5-10	5
10-15	6
15-20	8
20-25	10
25-30	25
30-35	20
35-40	18
40-45	4
45-50	2

Draw 'a less than' type cumulative frequency curves (ogive). Hence find median.

Class X
Mathematics
(CBSE 2019)
SOLUTION

GENERAL INSTRUCTIONS :

- (i) All questions are compulsory.
- (ii) This question paper consists of 30 questions divided into four sections - **A, B, C and D**.
- (iii) Section **A** contains 6 questions of 1 mark each. Section **B** contains 6 questions of 2 marks each. Section **C** contains 10 questions of 3 marks each. Section **D** contains 8 questions of 4 marks each.
- (iv) There is no overall choice. However, an internal choice has been provided in **two** questions of 1 mark, **two** questions of 2 marks, **four** questions of 3 marks each and **three** questions of 4 marks each. You have to attempt only **one** of the alternatives in all such questions.
- (v) Use of calculator is not permitted.

Section-A

Question numbers 1 to 6 carry 1 mark each.

1. Find the coordinates of a point A, where AB is diameter of a circle whose centre is (2, -3) and B is the point (1, 4). [1]

Sol. Let the centre be O and coordinates of point A be (x, y)

$$\frac{x+1}{2} = 2 \quad [\text{By Mid-point formula}]$$

$$\Rightarrow x = 3 \quad [1/2]$$

$$\frac{y+4}{2} = -3$$

$$\Rightarrow y = -10 \quad [1/2]$$

∴ Coordinates of A = (3, -10)

2. For what values of k, the roots of the equation $x^2 + 4x + k = 0$ are real? [1]

OR

Find the value of k for which the roots of the equation $3x^2 - 10x + k = 0$ are reciprocal of each other.

Sol. $x^2 + 4x + k = 0$

∴ Roots of given equation are real,

$$D \geq 0$$

[½]

$$\Rightarrow (4)^2 - 4 \times k \geq 0$$

$$\Rightarrow -4k \geq -16$$

$$\Rightarrow k \leq 4$$

∴ k has all real values ≤ 4

[½]

OR

$$3x^2 - 10x + k = 0$$

∴ Roots of given equation are reciprocal of each other.

Let the roots be α and $\frac{1}{\alpha}$

[½]

Product of roots = $\frac{c}{a}$

$$\Rightarrow \alpha \cdot \frac{1}{\alpha} = \frac{k}{3}$$

$$\therefore k = 3$$

[½]

3. Find A if $\tan 2A = \cot(A - 24^\circ)$

[1]

OR

Find the value of $(\sin^2 33^\circ + \sin^2 57^\circ)$

Sol. $\tan 2A = \cot(A - 24^\circ)$

$$\Rightarrow \cot(90^\circ - 2A) = \cot(A - 24^\circ)$$

[½]

$$\Rightarrow 90^\circ - 2A = A - 24^\circ$$

$$\Rightarrow 3A = 114^\circ$$

$$\Rightarrow A = 38^\circ$$

[½]

OR

$$\sin^2 33^\circ + \sin^2 57^\circ$$

$$= \sin^2 33^\circ + \cos^2 (90^\circ - 57^\circ)$$

[½]

$$= \sin^2 33^\circ + \cos^2 33^\circ$$

$$= 1$$

[½]

4. How many two digits numbers are divisible by 3?

[1]

Sol. Two digits numbers divisible by 3 are

12, 15, 18,, 99.

$$a = 12, d = 15 - 12 = 3$$

[½]

$$\Rightarrow T_n = 99$$

$$\Rightarrow a + (n - 1)d = 99$$

$$\Rightarrow 12 + (n - 1)3 = 99$$

$$\Rightarrow n = 30$$

∴ Number of two digit numbers divisible by 3 are 30.

[½]

QB365-Question Bank Software

5. In Fig. 1, $DE \parallel BC$, $AD = 1$ cm and $BD = 2$ cm. What is the ratio of the $\text{ar}(\triangle ABC)$ to the $\text{ar}(\triangle ADE)$? [1]

Fig. 1

Sol.

$DE \parallel BC$

$\therefore \triangle ADE \sim \triangle ABC$

[By AA similarity]

[½]

$$\frac{\text{ar}(\triangle ABC)}{\text{ar}(\triangle ADE)} = \left(\frac{AB}{AD}\right)^2$$

[By area similarity theorem]

$$= \left(\frac{3}{1}\right)^2$$

$$= \frac{9}{1}$$

[½]

6. Find a rational number between $\sqrt{2}$ and $\sqrt{3}$. [1]

Sol. Rational number lying between $\sqrt{2}$ and $\sqrt{3}$ is $1.5 = \frac{15}{10} = \frac{3}{2}$ [½]

[$\because \sqrt{2} \sim 1.414$ and $\sqrt{3} \sim 1.732$] [½]

Section-B

Question numbers 7 to 12 carry 2 marks each.

7. Find the HCF of 1260 and 7344 using Euclid's algorithm. [2]

OR

Show that every positive odd integer is of the form $(4q + 1)$ or $(4q + 3)$, where q is some integer.

Sol. Since $7344 > 1260$

$$7344 = 1260 \times 5 + 1044$$

[½]

Since remainder $\neq 0$

$$1260 = 1044 \times 1 + 216$$

$$1044 = 216 \times 4 + 180$$

[½]

$$216 = 180 \times 1 + 36$$

$$180 = 36 \times 5 + 0$$

[½]

The remainder has now become zero.

\therefore HCF of 1260 and 7344 is 36. [½]

OR

Let a be positive odd integer

Using division algorithm on a and b = 4

[½]

$$a = 4q + r$$

Since $0 \leq r < 4$, the possible remainders are 0, 1, 2 and 3

[½]

∴ a can be 4q or 4q + 1 or 4q + 2 or 4q + 3, where q is the quotient

Since a is odd, a cannot be 4q and 4q + 2

[½]

∴ Any odd integer is of the form 4q + 1 or 4q + 3, where q is some integer.

[½]

8. Which term of the AP 3, 15, 27, 39, will be 120 more than its 21st term?

[2]

OR

If S_n , the sum of first n terms of an AP is given by $S_n = 3n^2 - 4n$, find the nth term.

Sol. Given AP is

3, 15, 27, 39

where a = 3, d = 15 - 3 = 12

[½]

Let the nth term be 120 more than its 21st term.

$$t_n = t_{21} + 120$$

[½]

$$\Rightarrow 3 + (n - 1)12 = 3 + 20 \times 12 + 120$$

$$\Rightarrow (n - 1) \times 12 = 363 - 3$$

[½]

$$\Rightarrow (n - 1) = \frac{360}{12}$$

$$\therefore n = 31$$

$$\text{Hence, the required term is } t_{31} = 3 + 30 \times 12 = 363$$

[½]

OR

$$S_n = 3n^2 - 4n$$

Let S_{n-1} be sum of (n - 1) terms

$$t_n = S_n - S_{n-1}$$

[½]

$$= (3n^2 - 4n) - [3(n - 1)^2 - 4(n - 1)]$$

[½]

$$= (3n^2 - 4n) - [3n^2 - 6n + 3 - 4n + 4]$$

[½]

$$= 3n^2 - 4n - 3n^2 + 10n - 7$$

$$\therefore t_n = 6n - 7$$

So, required nth term = 6n - 7

[½]

9. Find the ratio in which the segment joining the points (1, -3) and (4, 5) is divided by x-axis? Also find the coordinates of this point on x-axis. [2]

Sol. Let P(x, y) divides the line segment joining the points A(1, -3) and B(4, 5) internally in the ratio k : 1.

Using section formula, we get

$$x = \frac{4k+1}{k+1} \quad \dots(i) \quad \text{and} \quad y = \frac{5k-3}{k+1} \quad \dots(ii)$$

[½]

Since, P lies on x-axis. So its ordinate will be zero.

$$\Rightarrow \frac{5k-3}{k+1} = 0$$

$$\Rightarrow k = \frac{3}{5}$$

Hence, the required ratio is 3 : 5.

[½]

QB365-Question Bank Software

Now putting the value of k in (i) and (ii), we get

$$x = \frac{17}{8} \text{ and } y = 0$$

So, coordinates of point P are $\left(\frac{17}{8}, 0\right)$ [1]

10. A game consists of tossing a coin 3 times and noting the outcome each time. If getting the same result in all the tosses is a success, find the probability of losing the game. [2]

Sol. Total possible outcomes are (HHH), (HHT), (HTH), (THH), (TTH), (THT), (HTT), (TTT) i.e., 8. [½]

The favourable outcomes to the event E 'Same result in all the tosses' are TTT, HHH. [½]

So, the number of favourable outcomes = 2

$$\therefore P(E) = \frac{2}{8} = \frac{1}{4} \quad [½]$$

Hence, probability of losing the game = $1 - P(E)$

$$= 1 - \frac{1}{4} = \frac{3}{4} \quad [½]$$

11. A die is thrown once. Find the probability of getting a number which (i) is a prime number (ii) lies between 2 and 6. [2]

Sol. Total outcomes = 1, 2, 3, 4, 5, 6 [½]

Prime numbers = 2, 3, 5

Numbers lie between 2 and 6 = 3, 4, 5 [½]

$$(i) P(\text{Prime Numbers}) = \frac{3}{6} = \frac{1}{2} \quad [½]$$

$$(ii) P(\text{Numbers lie between 2 and 6}) = \frac{3}{6} = \frac{1}{2} \quad [½]$$

12. Find c if the system of equations $cx + 3y + (3 - c) = 0$; $12x + cy - c = 0$ has infinitely many solutions? [2]

Sol. For infinitely many solutions

$$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2} \quad [½]$$

$$\begin{array}{ccc} \text{I} & \text{II} & \text{III} \\ \frac{c}{12} & = \frac{3}{c} & = \frac{3-c}{-c} \end{array}$$

$$(i) c^2 = 12 \times 3 \quad [\text{From I and II}]$$
$$c = \pm 6 \quad [½]$$

$$(ii) \frac{3}{c} = \frac{3-c}{-c} \quad [\text{From II and III}]$$

$$-3c = 3c - c^2$$

$$c^2 - 6c = 0$$

$$c = 0, 6$$

$$(iii) c^2 = 12(c - 3) \quad [\text{From I and III}] \quad [½]$$

$$c^2 - 12c + 36 = 0$$

$$(c - 6)^2 = 0$$

$$c = 6$$

Hence the value of c is 6. [½]

Section-C

Question numbers 13 to 22 carry 3 marks each.

13. Prove that $\sqrt{2}$ is an irrational number. [3]

Sol. Let $\sqrt{2}$ be rational. Then, there exist positive integers a and b such that $\sqrt{2} = \frac{a}{b}$, where a and b are

co-prime, $b \neq 0$ [1/2]

$$\Rightarrow (\sqrt{2})^2 = \left(\frac{a}{b}\right)^2 \quad [1/2]$$

$$\Rightarrow 2 = \frac{a^2}{b^2}$$

$$\Rightarrow 2b^2 = a^2$$

$\therefore 2$ divides a^2

$\Rightarrow 2$ divides a ... (i)

Let $a = 2c$ for some integer c

$$a^2 = 4c^2$$

$$\Rightarrow 2b^2 = 4c^2$$

$$\Rightarrow b^2 = 2c^2$$

$\therefore 2$ divides b^2

$\Rightarrow 2$ divides b ... (ii)

From (i) and (ii), we get

$\therefore 2$ is common factor of both a and b.

But this contradicts the fact that a and b have no common factor other than 1 [1/2]

\therefore Our supposition is wrong

Hence, $\sqrt{2}$ is an irrational number. [1/2]

14. Find the value of k such that the polynomial $x^2 - (k + 6)x + 2(2k - 1)$ has sum of its zeros equal to half of their product. [3]

Sol. For given polynomial

$$x^2 - (k + 6)x + 2(2k - 1), \quad [1/2]$$

Let the zeroes be α & β .

$$\text{So, } \alpha + \beta = -\frac{b}{a} = k + 6, \quad \alpha\beta = \frac{c}{a} = \frac{4k - 2}{1} \quad [1]$$

$$\therefore \text{Sum of zeroes} = \frac{1}{2} (\text{product of zeroes})$$

$$\Rightarrow \alpha + \beta = \frac{1}{2} \alpha\beta \quad [1/2]$$

$$\Rightarrow k + 6 = \frac{1}{2} (4k - 2)$$

QB365-Question Bank Software

$$\Rightarrow k + 6 = 2k - 1$$

$$\therefore k = 7$$

So, the value of k is 7

[1]

15. A father's age is three times the sum of the ages of his two children. After 5 years his age will be two times the sum of their ages. Find the present age of the father. [3]

OR

A fraction becomes $\frac{1}{3}$ when 2 is subtracted from the numerator and it becomes $\frac{1}{2}$ when 1 is subtracted from the denominator. Find the fraction.

Sol. Let the present age of father be x years and the sum of present ages of his two children be y years.

[½]

According to question

$$x = 3y$$

[½]

$$\Rightarrow x - 3y = 0 \quad \dots(1)$$

After 5 years,

$$x + 5 = 2(y + 10)$$

$$\Rightarrow x - 2y = 15 \quad \dots(2)$$

[½]

On subtracting equation (1) from (2), we get:

$$\begin{array}{r} x - 2y = 15 \\ x - 3y = 0 \\ \hline - \quad + \quad - \\ y = 15 \end{array}$$

[1]

On substituting the value of $y = 15$ in (1), we get:

$$x - 3 \times 15 = 0$$

$$\therefore x = 45$$

[½]

Hence, the present age of father is 45 years.

OR

Let the numerator of required fraction be x and the denominator of required fraction be y ($y \neq 0$)

According to question;

[½]

$$\frac{x-2}{y} = \frac{1}{3}$$

$$\Rightarrow 3x - 6 = y$$

[½]

$$\Rightarrow 3x - y = 6 \quad \dots(1)$$

and

$$\frac{x}{y-1} = \frac{1}{2}$$

$$\Rightarrow 2x = y - 1$$

[½]

$$\Rightarrow 2x - y = -1 \quad \dots(2)$$

On subtracting (2) from (1), we get:

QB365-Question Bank Software

$$\begin{array}{r} 3x - y = 6 \\ 2x - y = -1 \\ \hline - \quad + \quad + \\ x = 7 \end{array} \quad [1]$$

On substituting $x = 7$ in (1), we get:

$$\begin{aligned} 3(7) - y &= 6 \\ \Rightarrow -y &= 6 - 21 \\ \therefore y &= 15 \end{aligned} \quad [1/2]$$

Hence, the required fraction is $\frac{x}{y} = \frac{7}{15}$.

16. Find the point on y-axis which is equidistant from the points $(5, -2)$ and $(-3, 2)$. [3]

OR

The line segment joining the points $A(2, 1)$ and $B(5, -8)$ is trisected at the points P and Q such that P is nearer to A . If P also lies on the line given by $2x - y + k = 0$, find the value of k .

- Sol. Let the point on y-axis be $P(0, y)$ which is equidistant from the points $A(5, -2)$ and $B(-3, 2)$. [1/2]

We are given that $AP = BP$

$$\text{So, } AP^2 = BP^2 \quad [1/2]$$

$$\text{i.e., } (5 - 0)^2 + (-2 - y)^2 = (-3 - 0)^2 + (2 - y)^2 \quad [1]$$

$$\Rightarrow 25 + y^2 + 4 + 4y = 9 + 4 + y^2 - 4y$$

$$\Rightarrow 8y = -16$$

$$\Rightarrow y = -2 \quad [1]$$

Hence, the required point is $(0, -2)$

OR

Here, $AP : PB = 1 : 2$ [1/2]

$$\therefore P \equiv \left(\frac{1 \times 5 + 2 \times 2}{1 + 2}, \frac{1 \times (-8) + 2 \times 1}{1 + 2} \right)$$

$$\Rightarrow P \equiv (3, -2) \quad [1]$$

Since, P lies on the line $2x - y + k = 0$ [1/2]

$$\therefore 2(3) - (-2) + k = 0$$

$$\Rightarrow 6 + 2 + k = 0$$

$$\Rightarrow k = -8 \quad [1]$$

17. Prove that : $(\sin \theta + \operatorname{cosec} \theta)^2 + (\cos \theta + \sec \theta)^2 = 7 + \tan^2 \theta + \cot^2 \theta$. [3]

OR

Prove that : $(1 + \cot A - \operatorname{cosec} A)(1 + \tan A + \sec A) = 2$.

Sol. L.H.S : $(\sin \theta + \operatorname{cosec} \theta)^2 + (\cos \theta + \sec \theta)^2$

$$= \sin^2 \theta + \operatorname{cosec}^2 \theta + 2 + \cos^2 \theta + \sec^2 \theta + 2 \quad \left[\because \sin \theta = \frac{1}{\operatorname{cosec} \theta} \text{ and } \cos \theta = \frac{1}{\sec \theta} \right] \quad [1]$$

QB365-Question Bank Software

$$= \sin^2\theta + \cos^2\theta + 1 + \cot^2\theta + 1 + \tan^2\theta + 4 \quad [\because \operatorname{cosec}^2\theta + 1 + \cot^2\theta \text{ and } \sec^2\theta = 1 + \tan^2\theta] \quad [1]$$

$$= 1 + 1 + 1 + 4 + \tan^2\theta + \cot^2\theta \quad [\because \cos^2\theta + \sin^2\theta = 1] \quad [1/2]$$

$$= 7 + \tan^2\theta + \cot^2\theta$$

$$\text{L.H.S} = \text{R.H.S} \quad [1/2]$$

OR

$$\text{L.H.S:} \left(1 + \frac{\cos A}{\sin A} - \frac{1}{\sin A}\right) \left(1 + \frac{\sin A}{\cos A} + \frac{1}{\cos A}\right)$$

$$= \left(\frac{\sin A + \cos A - 1}{\sin A}\right) \left(\frac{\cos A + \sin A + 1}{\cos A}\right) \quad [1/2]$$

$$= \frac{(\sin A + \cos A)^2 - (1)^2}{\sin A \cdot \cos A} \quad [1/2]$$

$$= \frac{\sin^2 A + \cos^2 A + 2\sin A \cdot \cos A - 1}{\sin A \cdot \cos A} \quad [1/2]$$

$$= \frac{1 + 2\sin A \cdot \cos A - 1}{\sin A \cdot \cos A} \quad [\because \sin^2 A + \cos^2 A = 1] \quad [1/2]$$

$$= 2$$

$$\text{Hence, L.H.S} = \text{R.H.S} \quad [1]$$

18. In Fig. 2, PQ is a chord of length 8 cm of a circle of radius 5 cm and centre O. The tangents at P and Q intersect at point T. Find the length of TP. [3]

Sol. Join OT which bisects PQ at M and perpendicular to PQ

In $\triangle OPM$,

$$OP^2 = PM^2 + OM^2 \quad [\text{By pythagoras Theorem}]$$

$$\Rightarrow (5)^2 = (4)^2 + OM^2$$

$$\Rightarrow OM = 3 \text{ cm}$$

[1]

In $\triangle OPT$ and $\triangle OPM$,

$$\angle MOP = \angle TOP \quad [\text{Common angles}]$$

$$\angle OMP = \angle OPT \quad [\text{Each } 90^\circ]$$

$\therefore \Delta POT \sim \Delta MOP$ [By AA similarity] [1]

$\Rightarrow \frac{TP}{MP} = \frac{OP}{OM}$

$\Rightarrow TP = \frac{4 \times 5}{3}$ [$\because OP = 5 \text{ cm}, PM = 4 \text{ cm}, MO = 3 \text{ cm}$]

$\Rightarrow TP = \frac{20}{3} = 6\frac{2}{3} \text{ cm}$ [1]

19. In Fig. 3, $\angle ACB = 90^\circ$ and $CD \perp AB$, prove that $CD^2 = BD \times AD$. [3]

Fig. 3

OR

If P and Q are the points on side CA and CB respectively of ΔABC , right angled at C, prove that $(AQ^2 + BP^2) = (AB^2 + PQ^2)$

Sol.

Let $\angle A = \theta$

$\therefore \angle ACD = 90 - \theta, \angle BCD = \theta, \angle CBD = 90 - \theta$ [1/2]

$\therefore \angle CAD = \angle BCD$

and $\angle ACD = \angle CBD$ [1/2]

$\Delta CAD \sim \Delta BCD$ [By AA similarity] [1]

$\therefore \frac{AD}{CD} = \frac{CD}{BD}$ [1/2]

$\therefore CD^2 = AD \times BD$ [1/2]

OR

In right ΔACQ ,
 $AQ^2 = AC^2 + CQ^2$... (i) [By Pythagoras theorem] [1]

In right ΔPCB ,
 $BP^2 = PC^2 + CB^2$... (ii) [By Pythagoras theorem] [1]

QB365-Question Bank Software

On adding equations (i) and (ii), we get

$$AQ^2 + BP^2 = AC^2 + CQ^2 + PC^2 + CB^2 \quad [1/2]$$

$$= (AC^2 + CB^2) + (CQ^2 + PC^2)$$

$$= AB^2 + PQ^2 \quad [\text{By Pythagoras theorem}] \quad [1/2]$$

20. Find the area of the shaded region in Fig. 4, if ABCD is a rectangle with sides 8 cm and 6 cm and O is the centre of circle. (Take $\pi = 3.14$) [3]

Fig. 4

In right triangle ADC, $\angle D = 90^\circ$

$$AC^2 = AD^2 + DC^2 \quad [\text{By Pythagoras theorem}] \quad [1/2]$$

$$= 6^2 + 8^2 = 100$$

$$AC = 10 \text{ cm} \quad [1/2]$$

$$2(AO) = 10$$

$$AO = 5 \text{ cm}$$

$$\Rightarrow \text{Radius } (r) = 5 \text{ cm} \quad [1/2]$$

$$\text{Area of the shaded region} = \text{Area of the circle} - \text{Area of rectangle} \quad [1/2]$$

$$= \pi r^2 - l \times b$$

$$= 3.14(5)^2 - 6 \times 8 \quad [1/2]$$

$$= 78.5 - 48 = 30.5 \text{ cm}^2 \quad [1/2]$$

21. Water in a canal, 6 m wide and 1.5 m deep, is flowing with a speed of 10 km/hour. How much area will it irrigate in 30 minutes; if 8 cm standing water is needed? [3]

Sol. Width of the canal = 6 m

Depth of the canal = 1.5 m

Length of the water column formed in $\frac{1}{2}$ hr

$$= 5 \text{ km or } 5000 \text{ m} \quad [1/2]$$

\therefore Volume of water flowing in $\frac{1}{2}$ hr

= Volume of cuboid of length 5000 m, width 6 m and depth 1.5 m.

$$= 5000 \times 6 \times 1.5 = 45000 \text{ m}^3 \quad [1]$$

QB365-Question Bank Software

On comparing the volumes,

Volume of water in field = Volume of water coming out from canal in 30 minutes. [½]

Irrigated area × standing water = 45000.

$$\text{Irrigated Area} = \frac{45000}{\frac{8}{100}} \quad [\because 1 \text{ m} = 100 \text{ cm}] \quad [½]$$

$$= \frac{45000 \times 100}{8} = 5,62,500 \text{ m}^3 \quad [½]$$

22. Find the mode of the following frequency distribution. [3]

Class	0 - 10	10 - 20	20 - 30	30 - 40	40 - 50	50 - 60	60 - 70
Frequency	8	10	10	16	12	6	7

Sol.

Class	Frequency
0 - 10	8
10 - 20	10
20 - 30	10 → f_0
30 - 40	16 → f_1
40 - 50	12 → f_2
50 - 60	6
60 - 70	7

Here, 30 - 40 is the modal class, and $l = 30$, $h = 10$ [½]

$$\therefore \text{Mode} = l + \left(\frac{f_1 - f_0}{2f_1 - f_0 - f_2} \right) \times h \quad [1]$$

$$= 30 + \left(\frac{16 - 10}{2 \times 16 - 10 - 12} \right) \times 10 \quad [½]$$

$$= 30 + \frac{6}{10} \times 10 = 30 + 6 = 36 \quad [½]$$

Section-D

Question numbers 23 to 30 carry 4 marks each.

23. Two water taps together can fill a tank in $1\frac{7}{8}$ hours. The tap with longer diameter takes 2 hours less than the tap with smaller one to fill the tank separately. Find the time in which each tap can fill the tank separately. [4]

OR

A boat goes 30 km upstream and 44 km downstream in 10 hours. In 13 hours, it can go 40 km upstream and 55 km downstream. Determine the speed of the stream and that of the boat in still water.

Sol. Let the time in which tap with longer and smaller diameter can fill the tank separately be x hours and y hours respectively. [½]

QB365-Question Bank Software

According to the question

$$\frac{1}{x} + \frac{1}{y} = \frac{8}{15} \quad \dots(i) \quad [1/2]$$

and $x = y - 2$... (ii) $[1/2]$

On substituting $x = y - 2$ from (ii) in (i), we get

$$\frac{1}{y-2} + \frac{1}{y} = \frac{8}{15} \quad [1/2]$$

$$\Rightarrow \frac{y+y-2}{y^2-2y} = \frac{8}{15}$$

$$\Rightarrow 15(2y-2) = 8(y^2-2y)$$

$$\Rightarrow 30y - 30 = 8y^2 - 16y$$

$$\Rightarrow 8y^2 - 46y + 30 = 0 \quad [1/2]$$

$$\Rightarrow 4y^2 - 20y - 3y + 15 = 0$$

$$\Rightarrow (4y-3)(y-5) = 0$$

$$\Rightarrow y = \frac{3}{4}, y = 5 \quad [1/2]$$

Substituting values of y in (ii), we get

$$x = \frac{3}{4} - 2 \quad \left| \quad x = 5 - 2 \quad [1/2]\right.$$

$$x = \frac{-5}{4} \quad \left| \quad x = 3\right.$$

$$\therefore x \neq \frac{-5}{4}$$

(time cannot be negative)

Hence, the time taken by tap with longer diameter is 3 hours and the time taken by tap with smaller diameter is 5 hours, in order to fill the tank separately. [1/2]

OR

Let the speed of the boat in still water be x km/h and speed of the stream be y km/h. [1/2]

According to question,

$$\frac{30}{x-y} + \frac{44}{x+y} = 10 \quad \dots(i)$$

and $\frac{40}{x-y} + \frac{55}{x+y} = 13$... (ii) $[1/2]$

Let $\frac{1}{x-y} = a$

and $\frac{1}{x+y} = b$, then we get

$$30a + 44b = 10 \quad \dots (iii)$$

$$40a + 55b = 13 \quad \dots(iv) \quad [1/2]$$

On solving (iii) and (iv), we get

$$120a + 176b = 40$$

$$120a + 165b = 39$$

$$\begin{array}{r} - \quad - \quad - \\ 11b = 1 \end{array}$$

[½]

$$\Rightarrow b = \frac{1}{11}$$

Substituting $b = \frac{1}{11}$ in (iii), we get

$$30a + 44 \times \frac{1}{11} = 10$$

$$\Rightarrow a = \frac{1}{5}$$

[½]

$$\therefore a = \frac{1}{5} \text{ \& } b = \frac{1}{11}$$

$$\Rightarrow x - y = 5 \quad \dots(v)$$

$$\text{and } x + y = 11 \quad \dots(vi)$$

Adding (v) and (vi), we get

[½]

$$\begin{array}{r} x - y = 5 \\ x + y = 11 \\ \hline 2x = 16 \end{array}$$

$$\therefore x = 8$$

[½]

Substituting $x = 8$ in (vi), we get

$$8 + y = 11$$

$$\therefore y = 3$$

Hence, speed of the stream is 3 km/h & speed of the boat in still water is 8 km/h.

[½]

24. If the sum of first four terms of an AP is 40 and that of first 14 terms is 280. Find the sum of its first n terms. [4]

Sol. Let the first four terms be $a, a + d, a + 2d, a + 3d$

$$a + a + d + a + 2d + a + 3d = 40$$

[½]

$$\Rightarrow 2a + 3d = 20 \quad \dots(i)$$

[½]

Sum of first 14 terms = 280

$$\frac{n}{2}[2a + (n-1)d] = 280$$

[½]

$$\Rightarrow \frac{14}{2}[2a + 13d] = 280$$

$$\Rightarrow 2a + 13d = 40$$

...(ii)

[1]

On subtracting (i) from (ii), we get $d = 2$

Put the value of d in (i) [½]

$$a = 7$$

$$\therefore \text{Sum of } n \text{ terms} = \frac{n}{2}[2a + (n-1)d] \quad [½]$$

$$= \frac{n}{2}[14 + (n-1)2] \quad [½]$$

$$= n^2 + 6n \quad [½]$$

25. Prove that $\frac{\sin A - \cos A + 1}{\sin A + \cos A - 1} = \frac{1}{\sec A - \tan A}$ [4]

Sol. LHS = $\frac{\sin A - \cos A + 1}{\sin A + \cos A - 1}$ [½]

$$= \frac{\tan A - 1 + \sec A}{\tan A + 1 - \sec A} \quad \text{(Dividing numerator \& denominator by } \cos A \text{)} \quad [½]$$

$$= \frac{(\tan A + \sec A) - 1}{(\tan A - \sec A) + 1} \quad [½]$$

$$= \frac{\{(\tan A + \sec A) - 1\}(\tan A - \sec A)}{\{(\tan A - \sec A) + 1\}(\tan A - \sec A)} \quad [½]$$

$$= \frac{(\tan^2 A - \sec^2 A) - (\tan A - \sec A)}{\{(\tan A - \sec A) + 1\}(\tan A - \sec A)} \quad [½]$$

$$= \frac{-1 - \tan A + \sec A}{(\tan A - \sec A + 1)(\tan A - \sec A)} \quad [½]$$

$$= \frac{-1}{\tan A - \sec A} \quad [½]$$

$$= \frac{1}{\sec A - \tan A} \quad [½]$$

LHS = RHS

Hence Proved.

26. A man in a boat rowing away from a light house 100 m high takes 2 minutes to change the angle of elevation of the top of the light house from 60° to 30° . Find the speed of the boat in metres per minute. [Use $\sqrt{3} = 1.732$] [4]

OR

Two poles of equal heights are standing opposite each other on either side of the road, which is 80 m wide. From a point between them on the road, the angles of elevation of the top of the poles are 60° and 30° respectively. Find the height of the poles and the distances of the point from the poles.

QB365-Question Bank Software

Sol. Let the tower be PQ and the boat changes its position from R to S.

Here, PQ = 100 m, $\angle PRQ = 60^\circ$ and $\angle PSR = 30^\circ$.

In $\triangle PQR$,

$$\tan 60^\circ = \frac{PQ}{QR} = \frac{100}{QR}$$

$$\Rightarrow QR = \frac{100\sqrt{3}}{3} \text{ m} \quad \dots(i)$$

In $\triangle PQS$,

$$\tan 30^\circ = \frac{PQ}{QS}$$

$$\Rightarrow \frac{1}{\sqrt{3}} = \frac{100}{QS}$$

$$\Rightarrow QS = 100\sqrt{3} \text{ m}$$

$$\therefore RS = QS - QR = 100\sqrt{3} - \frac{100\sqrt{3}}{3} = \frac{200\sqrt{3}}{3}$$

$$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$$

$$= \frac{200\sqrt{3}}{3 \times 2} = \frac{100\sqrt{3}}{3}$$

$$= 57.73 \text{ (approx.) (Using } \sqrt{3} = 1.732)$$

$$= 57.73 \text{ m/min}$$

[1]

[1]

[1]

[1]

OR

Let the poles be AB, CD each of height h meter and E is the point between the poles on the road.

Let $\angle AEB = 60^\circ$, $\angle CED = 30^\circ$ and DE be x meter.

$$\therefore BE = (80 - x) \text{ m}$$

In $\triangle AEB$,

$$\tan 60^\circ = \frac{AB}{BE}$$

$$\Rightarrow \sqrt{3} = \frac{h}{(80 - x)}$$

$$\Rightarrow h = \sqrt{3}(80 - x) \text{ m} \quad \dots(i)$$

[1/2]

[1/2]

In $\triangle CDE$,

$$\tan 30^\circ = \frac{CD}{DE}$$

$$\Rightarrow \frac{1}{\sqrt{3}} = \frac{h}{x}$$

[1/2]

$$\Rightarrow h = \frac{x}{\sqrt{3}} \text{ m} \quad \dots(\text{ii}) \quad \left[\frac{1}{2} \right]$$

From equation (i) and (ii), we get

$$\frac{x}{\sqrt{3}} = \sqrt{3}(80 - x) \quad \left[\frac{1}{2} \right]$$

$$\Rightarrow x = 240 - 3x$$

$$\Rightarrow 4x = 240$$

$$\Rightarrow x = 60 \text{ m} \quad \left[\frac{1}{2} \right]$$

Put value of x in equation (ii), we get

$$h = 20\sqrt{3} \text{ m, DE} = 60 \text{ m and BE} = 20 \text{ m}$$

Hence, the heights of each pole is $20\sqrt{3}$ m and distance of the point from the poles are 60 m and 20 m. [1/2]

27. Construct a $\triangle ABC$ in which $CA = 6$ cm, $AB = 5$ cm and $\angle BAC = 45^\circ$. Then construct a triangle whose sides are $\frac{3}{5}$ of the corresponding sides of $\triangle ABC$. [4]

Sol.

[2 1/2]

Steps of construction :

- (i) Construct $\triangle ABC$ such that $AB = 5$ cm, $\angle CAB = 45^\circ$ and $CA = 6$ cm.
- (ii) Draw any ray AX making an acute angle with AB on the side opposite to the vertex C .
- (iii) Mark points A_1, A_2, A_3, A_4, A_5 on AX such that $AA_1 = A_1A_2 = A_2A_3 = A_3A_4 = A_4A_5$.
- (iv) Join A_5B .
- (v) Through A_3 , draw a line parallel to A_5B intersecting with AB at B' .
- (vi) Through B' , draw a line parallel to BC intersecting with AC at C' .

Now, $\triangle AB'C'$ is the required triangle whose sides are $\frac{3}{5}$ of the corresponding sides of $\triangle ABC$. [1 1/2]

QB365-Question Bank Software

28. A bucket open at the top is in the form of a frustum of a cone with a capacity of 12308.8 cm^3 . The radii of the top and bottom of circular ends of the bucket are 20 cm and 12 cm respectively. Find the height of the bucket and also the area of the metal sheet used in making it. (Use $\pi = 3.14$) [4]

Let the height of the bucket be h cm and slant height be l cm.

Here $r_1 = 20$ cm

$r_2 = 12$ cm

And capacity of bucket = 12308.8 cm^3

We know that capacity of bucket = $\frac{\pi h}{3}(r_1^2 + r_2^2 + r_1 r_2)$

$$= 3.14 \times \frac{h}{3} [400 + 144 + 240]$$

$$= 3.14 \times \frac{h}{3} \times 784$$

So we have $\frac{h}{3} \times 3.14 \times 784 = 12308.8$

$$h = \frac{12308.8 \times 3}{3.14 \times 784}$$

$$= 15 \text{ cm}$$

Now, the slant height of the frustum,

$$l = \sqrt{h^2 + (r_1 - r_2)^2}$$

$$= \sqrt{15^2 + 8^2}$$

$$= \sqrt{289}$$

$$= 17 \text{ cm}$$

Area of metal sheet used in making it

$$= \pi r_2^2 + \pi(r_1 + r_2)l$$

$$= 3.14 \times [144 + (20 + 12) \times 17]$$

$$= 2160.32 \text{ cm}^2$$

29. Prove that in a right angle triangle, the square of the hypotenuse is equal the sum of squares of the other two sides. [4]

Sol. Given : A right triangle ABC in which $\angle B = 90^\circ$

To Prove : (Hypotenuse)² = (Base)² + (Perpendicular)²

i.e. $AC^2 = AB^2 + BC^2$

Construction : From B, draw $BD \perp AC$

[½]

Proof : In $\triangle ABC$ and $\triangle ADB$

$\angle BAC = \angle DAB$ [Common]

$\angle ABC = \angle ADB$ [Each 90°]

$\therefore \triangle ABC \sim \triangle ADB$ [By AA similarity]

[½]

$\Rightarrow \frac{AB}{AD} = \frac{AC}{AB}$

$\Rightarrow AB^2 = AD \times AC$... (i)

[½]

Similarly, $\triangle ABC \sim \triangle BDC$

[½]

$\Rightarrow \frac{BC}{DC} = \frac{AC}{BC}$

$\Rightarrow BC^2 = AC \times DC$... (ii)

[½]

On Adding (i) and (ii), we get

$AB^2 + BC^2 = AD \times AC + AC \times DC$

[½]

$\Rightarrow AB^2 + BC^2 = AC(AD + DC)$

$\Rightarrow AB^2 + BC^2 = AC \times AC$

$\therefore AC^2 = AB^2 + BC^2$

[½]

30. If the median of the following frequency distribution is 32.5. Find the values of f_1 and f_2 .

[4]

Class	0-10	10-20	20-30	30-40	40-50	50-60	60-70	Total
Frequency	f_1	5	9	12	f_2	3	2	40

OR

The marks obtained by 100 students of a class in an examination are given below.

Marks	No. of Students
0-5	2
5-10	5
10-15	6
15-20	8
20-25	10
25-30	25
30-35	20
35-40	18
40-45	4
45-50	2

Draw 'a less than' type cumulative frequency curves (ogive). Hence find median.

Sol.

Class	Frequency	Cumulative Frequency
0 – 10	f_1	f_1
10 – 20	5	$5 + f_1$
20 – 30	9	$14 + f_1$
30 – 40	12	$26 + f_1$
40 – 50	f_2	$26 + f_1 + f_2$
50 – 60	3	$29 + f_1 + f_2$
60 – 70	2	$31 + f_1 + f_2$
Total = 40 = n		

[1]

$$f_1 + 5 + 9 + 12 + f_2 + 3 + 2 = 40$$

$$f_1 + f_2 = 40 - 31 = 9$$

...(i)

[½]

$$\text{Median} = 32.5$$

[Given]

∴ Median Class is 30 – 40

$$l = 30, h = 10, cf = 14 + f_1, f = 12$$

[½]

$$\text{Median} = l + \left(\frac{\frac{n}{2} - cf}{f} \right) \times h$$

[½]

$$32.5 = 30 + \left[\frac{\frac{40}{2} - (14 + f_1)}{12} \right] \times 10$$

[½]

$$2.5 = \frac{10}{12} (20 - 14 - f_1)$$

$$3 = 6 - f_1$$

$$f_1 = 3$$

[½]

On putting in (i),

$$f_1 + f_2 = 9$$

$$f_2 = 9 - 3$$

$$[\because f_1 = 3]$$

[½]

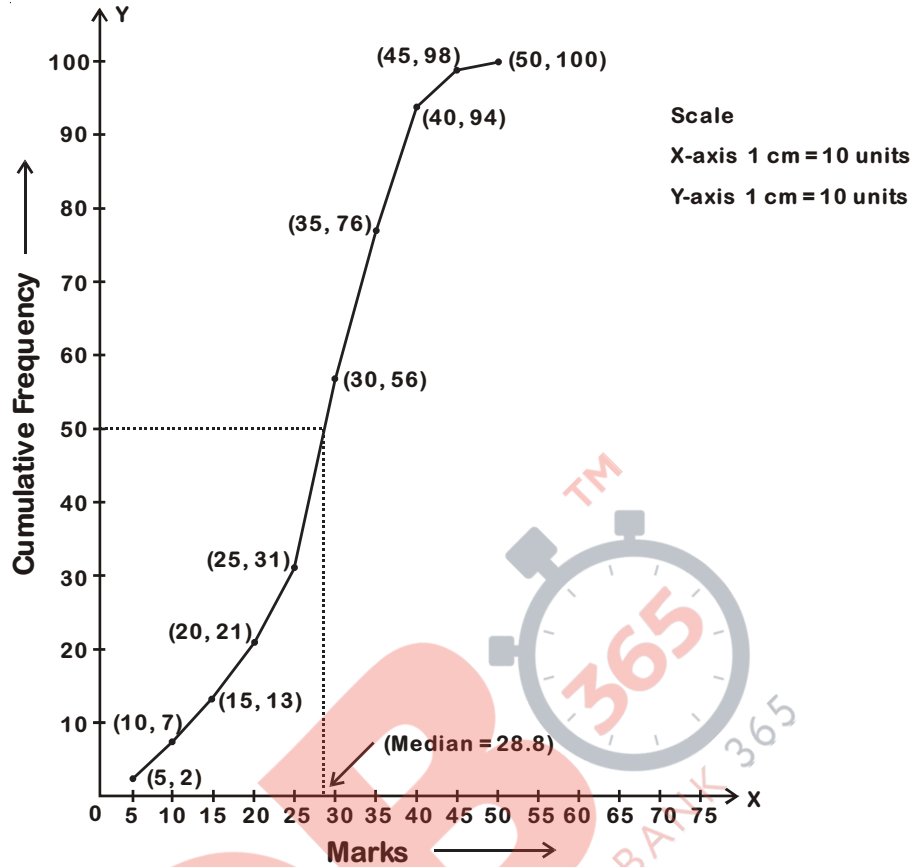

$$= 6$$

OR

40-45	4	less than 45	98
45-50	2	less than 50	100

QB365-Question Bank Software

Let us now plot the points corresponding to the ordered pairs (5, 2), (10, 7), (15, 13), (20, 21), (25, 31), (30, 56), (35, 76), (40, 94), (45, 98), (50, 100). Join all the points by a smooth curve.

Locate $\frac{n}{2} = \frac{100}{2} = 50$ on Y-axis

From this point draw a line parallel to X-axis cutting the curve at a point. From this point, draw a perpendicular to X-axis. The point of intersection of perpendicular with the X-axis determines the median of the data.

Therefore median = 28.8
