Class 12 Maths

Chapter 8

Ex 8.2

Solution of Simultaneous Linear Equations Ex 8.2 Q1

$$\begin{aligned}2x - y + z &= 0 \\3x + 2y - z &= 0 \\x + 4y + 3z &= 0\end{aligned}$$

The system can be written as

$$\begin{bmatrix} 2 & -1 & 1 \\ 3 & 2 & -1 \\ 1 & 4 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

or $A \quad x = 0$

$$\begin{aligned}|\mathcal{A}| &= 2(10) + 1(10) + 1(10) \\&= 40 \\&\neq 0\end{aligned}$$

Since $|\mathcal{A}| \neq 0$, hence $x = y = z = 0$ is the only solution of this homogeneous system.

Solution of Simultaneous Linear Equations Ex 8.2 Q2

$$\begin{aligned}2x - y + 2z &= 0 \\5x + 3y - z &= 0 \\x + 5y - 5z &= 0\end{aligned}$$

$$\begin{bmatrix} 2 & -1 & 2 \\ 5 & 3 & -1 \\ 1 & 5 & -5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \end{bmatrix}$$

or $A \quad x = 0$

$$\begin{aligned}|\mathcal{A}| &= 2(-10) + 1(-24) + 2(22) \\&= -20 - 24 + 44 \\&= 0\end{aligned}$$

Hence, the system has infinite solutions.

$$\text{Let } z = k$$

$$\begin{aligned}2x - y &= -2k \\5x + 3y &= k \\[2 \quad -1] \begin{bmatrix} x \\ y \end{bmatrix} &= \begin{bmatrix} -2k \\ k \end{bmatrix} \\A \quad x &= B\end{aligned}$$

$$|\mathcal{A}| = 6 + 5 = 11 \neq 0 \quad \text{so } A^{-1} \text{ exist}$$

$$\text{Now } \text{adj } A = \begin{bmatrix} 3 & -5 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 3 & 1 \\ -5 & 2 \end{bmatrix}$$

$$x = A^{-1} \cdot B = \frac{1}{|\mathcal{A}|} (\text{adj } A) B = \frac{1}{11} \begin{bmatrix} 3 & 1 \\ -5 & 2 \end{bmatrix} \begin{bmatrix} -2k \\ k \end{bmatrix} = \begin{bmatrix} \frac{-5k}{11} \\ \frac{12k}{11} \end{bmatrix}$$

$$\text{Hence, } x = \frac{-5k}{11}, y = \frac{12k}{11}, z = k$$

Solution of Simultaneous Linear Equations Ex 8.2 Q3

$$3x - y + 2z = 0$$

$$4x + 3y + 3z = 0$$

$$5x + 7y + 4z = 0$$

$$|A| = \begin{bmatrix} 3 & -1 & 2 \\ 4 & 3 & 3 \\ 5 & 7 & 4 \end{bmatrix}$$

$$\begin{aligned} &= B(-9) + 1(1) + 2(13) = -27 + 1 + 26 = -27 + 27 \\ &= 0 \end{aligned}$$

Hence, it has infinite solutions.

Let $z = k$

$$3x - y = -2k$$

$$4x + 3y = -3k$$

or $\begin{bmatrix} 3 & -1 \\ 4 & 3 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} -2k \\ -3k \end{bmatrix}$

or $A \begin{bmatrix} x \\ y \end{bmatrix} = B$

$$|A| = 9 + 4 = 13 \neq 0 \text{ hence } A^{-1} \text{ exists}$$

$$\text{adj } A = \begin{bmatrix} 3 & -4 \\ 1 & 3 \end{bmatrix}' = \begin{bmatrix} 3 & 1 \\ -4 & 3 \end{bmatrix}$$

$$\text{Now } x = A^{-1}B = \frac{1}{|A|}(\text{adj } A)B$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \frac{1}{13} \begin{bmatrix} 3 & 1 \\ -4 & 3 \end{bmatrix} \begin{bmatrix} -2k \\ -3k \end{bmatrix} = \frac{1}{13} \begin{bmatrix} -9k \\ -k \end{bmatrix}$$

$$\text{Hence, } x = \frac{-9k}{13}, y = \frac{-k}{13}, z = k$$

Solution of Simultaneous Linear Equations Ex 8.2 Q4

$$x + y - 6z = 0$$

$$x - y + 2z = 0$$

$$-3x + y + 2z = 0$$

Hence, $|A| = \begin{bmatrix} 1 & 1 & -6 \\ 1 & -1 & 2 \\ -3 & 1 & 2 \end{bmatrix}$

$$\begin{aligned} &= 1(-4) - 1(8) - 6(-2) \\ &= -4 - 8 + 12 \\ &= 0 \end{aligned}$$

Hence, the system has infinite solutions.

Let $z = k$

$$x + y = 6k$$

$$x - y = -2k$$

or $\begin{bmatrix} 1 & +1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 6k \\ -2k \end{bmatrix}$

or $A \begin{bmatrix} x \\ y \end{bmatrix} = B$

$$|A| = -1 - 1 = -2 \neq 0 \text{ hence } A^{-1} \text{ exists.}$$

$$\text{adj } A = \begin{bmatrix} -1 & -1 \\ -1 & +1 \end{bmatrix}$$

$$x = A^{-1}B = \frac{1}{|A|}(\text{adj } A)B = \frac{1}{-2} \begin{bmatrix} -1 & -1 \\ -1 & +1 \end{bmatrix} \begin{bmatrix} 6k \\ -2k \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \frac{1}{-2} \begin{bmatrix} -6k + 2k \\ -6k - 2k \end{bmatrix} = \left(\frac{1}{-2} \right) \begin{bmatrix} -4k \\ -8k \end{bmatrix} = \frac{-1}{2} \begin{bmatrix} -4k \\ -8k \end{bmatrix} = \begin{bmatrix} 2k \\ 4k \end{bmatrix}$$

Hence, $x = 2k, y = 4k, z = k$

Solution of Simultaneous Linear Equations Ex 8.2 Q5

$$x + y + z = 0$$

$$x - y - 5z = 0$$

$$x + 2y + 4z = 0$$

$$\begin{aligned} |A| &= \begin{bmatrix} 1 & 1 & 1 \\ 1 & -1 & -5 \\ 1 & 2 & 4 \end{bmatrix} \\ &= 1(6) - 1(9) + 1(3) = 9 - 9 = 0 \end{aligned}$$

Hence, the system has infinite solutions.

Let $z = k$

$$x + y = -k$$

$$x - y = 5k$$

$$\begin{bmatrix} 1 & 1 \\ 1 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} -k \\ 5k \end{bmatrix}$$

or $A \begin{bmatrix} x \\ y \end{bmatrix} = B$

$$|A| = -2 \neq 0, \text{ hence } A^{-1} \text{ exists.}$$

$$\text{adj } A = \begin{bmatrix} -1 & -1 \\ -1 & 1 \end{bmatrix}$$

$$\text{so, } x = A^{-1}B = \frac{1}{|A|}(\text{adj } A)B = \frac{1}{-2} \begin{bmatrix} -1 & -1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} -k \\ 5k \end{bmatrix}$$

$$\begin{bmatrix} x \\ y \end{bmatrix} = \left(\frac{1}{-2} \right) \begin{bmatrix} k - 5k \\ k + 5k \end{bmatrix} = \begin{bmatrix} 2k \\ -3k \end{bmatrix}$$

$$x = 2k, y = -3k, z = k$$

Solution of Simultaneous Linear Equations Ex 8.2 Q6

$$\begin{aligned}x + y - z &= 0 \\x - 2y + z &= 0 \\3x + 6y - 5z &= 0\end{aligned}$$

$$\text{Hence, } |A| = \begin{vmatrix} 1 & 1 & -1 \\ 1 & -2 & 1 \\ 3 & 6 & -5 \end{vmatrix} = 1(4) - 1(-8) - 1(12) = 4 + 8 - 12 = 0$$

Hence, the system will have infinite solutions.

$$\text{Let } z = k$$

$$x + y = -k$$

$$x - 2y = -k$$

$$\text{or } \begin{bmatrix} 1 & 1 \\ 1 & -2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} k \\ -k \end{bmatrix}$$

$$\text{or } A \begin{bmatrix} x \\ y \end{bmatrix} = B$$

$$|A| = -3 \neq 0, \text{ hence } A^{-1} \text{ exists.}$$

$$\text{Now, adj } A = \begin{bmatrix} -2 & -1 \\ -1 & 1 \end{bmatrix}^T = \begin{bmatrix} -2 & -1 \\ -1 & 1 \end{bmatrix}$$

$$\text{Next } x = A^{-1}B$$

$$= \frac{1}{|A|} (\text{adj } A)(B) = \frac{1}{-3} \begin{bmatrix} -2 & -1 \\ -1 & 1 \end{bmatrix} \begin{bmatrix} k \\ -k \end{bmatrix}$$

$$= \frac{-1}{3} \begin{bmatrix} -2k + k \\ -2k \end{bmatrix}$$

$$= \frac{-1}{3} \begin{bmatrix} -k \\ -2k \end{bmatrix} = \begin{bmatrix} \frac{k}{3} \\ \frac{2k}{3} \end{bmatrix}$$

$$\text{Hence, } x = \frac{k}{3}, y = \frac{2k}{3}, z = k$$

$$\text{or } x = k, y = 2k, z = 3k$$

Solution of Simultaneous Linear Equations Ex 8.2 Q7

$$3x + y - 2z = 0$$

$$x + y + z = 0$$

$$x - 2y + z = 0$$

Hence, $|A| = \begin{bmatrix} 3 & 1 & -2 \\ 1 & 1 & 1 \\ 1 & -2 & 1 \end{bmatrix}$

$$\begin{aligned}|A| &= B(1+2) - 1(1-1) - 2(-3) \\&= 9 - 0 + 6 \\&= 15 \neq 0\end{aligned}$$

Hence, the given system has only trivial solutions given by $x = y = z = 0$

Solution of Simultaneous Linear Equations Ex 8.2 Q8

$$2x + 3y - z = 0$$

$$x - y - 2z = 0$$

$$3x + y + 3z = 0$$

Hence, $A = \begin{bmatrix} 2 & 3 & -1 \\ 1 & -1 & -2 \\ 3 & 1 & 3 \end{bmatrix}$

$$|A| = \begin{bmatrix} 2 & 3 & -1 \\ 1 & -1 & -2 \\ 3 & 1 & 3 \end{bmatrix}$$

$$\begin{aligned}&= 2(-3+2) - 3(3+6) - 1(4) \\&= -2 - 27 - 4 \\&\neq 0\end{aligned}$$

Hence, the system has only trivial solutions given by $x = y = z = 0$
