

Very Short Answer Type Questions

[1 Marks]

Que 1. Express $\sin 67^\circ + \cos 75^\circ$ in terms of trigonometric ratios of angles between 0° and 45° .

Sol. $\sin 67^\circ + \cos 75^\circ$
 $= \sin (90^\circ - 23^\circ) + \cos (90^\circ - 15^\circ) = \cos 23^\circ + \sin 15^\circ$

Que 2. Evaluate:

(i) $\frac{\sin 18^\circ}{\cos 72^\circ}$

(ii) $\frac{\tan 26^\circ}{\cot 64^\circ}$

(iii) $\cos 48^\circ - \sin 42^\circ$

(iv) $\operatorname{cosec} 31^\circ - \sec 59^\circ$

Sol. (i) $\frac{\sin 18^\circ}{\cos 72^\circ} = \frac{\sin (90^\circ - 72^\circ)}{\cos 72^\circ} = \frac{\cos 72^\circ}{\cos 72^\circ} = 1$

(ii) $\frac{\tan 26^\circ}{\cot 64^\circ} = \frac{\tan (90^\circ - 64^\circ)}{\cot 64^\circ} = \frac{\cot 64^\circ}{\cot 64^\circ} = 1$

(iii) $\cos 48^\circ - \sin 42^\circ = \cos (90^\circ - 42^\circ) - \sin 42^\circ$

(iv) $\operatorname{cosec} 31^\circ - \sec 59^\circ = \operatorname{cosec} (90^\circ - 59^\circ) - \sec 59^\circ$
 $= \sec 59^\circ - \sec 59^\circ = 0.$

Que 3. In $\triangle ABC$ right angled at C, find the value of $\cos (A + B)$.

Fig. 10.2

Sol. In Fig. 10.2

$\because \angle C = 90^\circ$

$\therefore \angle A + \angle B = 90^\circ$ (By angle sum property)

Hence, $\cos (A + B) = \cos (90^\circ) = 0.$

Que 4. Can the value of the expression $(\cos 80^\circ - \sin 80^\circ)$ be negative? Justify your answer.

Sol. True, for $\theta > 45^\circ$, $\sin \theta > \cos \theta$, so $\cos 80^\circ - \sin 80^\circ$ has a negative value.

Que 5. If $\sin A + \sin^2 A = 1$, then show that $\cos^2 A + \cos^4 A = 1$.

Sol. $\sin A + \sin^2 A = 1 \Rightarrow \sin A = 1 - \sin^2 A = \cos^2 A$

$\therefore \cos^2 A + \cos^4 A = \sin A + \sin^2 A = 1.$

Que 6. Write the value of $\cot^2 \theta - \frac{1}{\sin^2 \theta}$.

Sol. $\cot^2 \theta - \frac{1}{\sin^2 \theta} = \cot^2 \theta - \operatorname{cosec}^2 \theta = 1$.

Que 7. If $\sin \theta = \frac{1}{3}$, then find the value of $2 \cot^2 \theta + 2$.

Sol. $2 \cot^2 \theta + 2 = 2 (\cot^2 \theta + 1) = 2 \operatorname{cosec}^2 \theta = \frac{2}{\sin^2 \theta} = \frac{2}{\left(\frac{1}{3}\right)^2} = 2 \times 9 = 18$.

Short Answer Type Questions – I

[2 marks]

Que 1. Evaluate $\cos 48^\circ \cos 42^\circ - \sin 48^\circ \sin 42^\circ$.

Sol. $\cos 48^\circ \cos 42^\circ - \sin 48^\circ \sin 42^\circ = \cos (90^\circ - 42^\circ) \cos (90^\circ - 48^\circ) - \sin 48^\circ \sin 42^\circ$
 $= \sin 42^\circ \sin 48^\circ - \sin 48^\circ \sin 42^\circ$ [$\because \cos (90 - \theta) = \sin \theta$]
 $= 0$

Que 2. Find the value of: $3 \sin^2 20^\circ - 2 \tan^2 45^\circ + 3 \sin^2 70^\circ$

Sol. $3 \sin^2 20^\circ - 2 \tan^2 45^\circ + 3 \sin^2 70^\circ$
 $= 3 \sin^2 (90^\circ - 70^\circ) - 2(1)^2 + 3 \sin^2 70^\circ$ [$\because \tan 45^\circ = 1$]
 $= 3 \cos^2 70^\circ - 2 + 3 \sin^2 70^\circ$ [$\because \sin (90 - \theta) = \cos \theta$]
 $= 3 (\sin^2 70^\circ + \cos^2 70^\circ) - 2$
 $= 3 \times 1 - 2 = 3 - 2 = 1.$ [$\because \sin^2 \theta + \cos^2 \theta = 1$]

Que 3. If $\sin^2 A = 2 \sin A$ then find the value of A.

Sol. $\sin^2 A = 2 \sin A$
 $\Rightarrow \sin^2 A - 2 \sin A = 0 \Rightarrow \sin A (\sin A - 2) = 0$
 \Rightarrow either $\sin A = 0$ or $\sin A - 2 = 0$.
 $\Rightarrow A = 0^\circ$ [$\sin A = 2, \text{Not possible}$]
 \therefore Value of $\angle A = 0^\circ$

Que 4. Find maximum value of $\frac{1}{\sec \theta}$, $0^\circ \leq \theta \leq 90^\circ$.

Sol. $\frac{1}{\sec \theta}$, ($0^\circ \leq \theta \leq 90^\circ$) (Given)
 $\because \sec \theta$ is in the denominator
 \therefore The min. value of $\sec \theta$ will return max. Value for $\frac{1}{\sec \theta}$.
But the min. Value of $\sec \theta$ is $\sec 0^\circ = 1$.
Hence, the max. Value of $\frac{1}{\sec 0^\circ} = \frac{1}{1} = 1$.

Que 5. Given that $\sin \theta = \frac{a}{b}$, find the value of $\tan \theta$.

Sol. $\sin \theta = \frac{a}{b}$
 $\Rightarrow \cos \theta = \sqrt{1 - \sin^2 \theta} = \sqrt{1 - \frac{a^2}{b^2}} = \sqrt{\frac{b^2 - a^2}{b^2}} = \sqrt{\frac{b^2 - a^2}{b}}$
 $\tan \theta = \frac{\sin \theta}{\cos \theta} = \frac{\frac{a}{b}}{\sqrt{\frac{b^2 - a^2}{b}}} = \frac{a}{\sqrt{b^2 - a^2}}$

Que 6. If $\sin \theta = \cos \theta$, then find the value of $2 \tan \theta + \cos^2 \theta$.

Sol. $\sin \theta = \cos \theta$ (Given)

It means value of $\theta = 45^\circ$

Now, $2 \tan \theta + \cos^2 \theta = 2 \tan 45^\circ + \cos^2 45^\circ$

$$= 2 \times 1 + \left(\frac{1}{\sqrt{2}}\right)^2 \quad \left(\because \tan 45^\circ = 1, \cos 45^\circ = \frac{1}{\sqrt{2}}\right)$$

$$= 2 + \frac{1}{2} = \frac{4+1}{2} = \frac{5}{2}$$

Que 7. If $\sin (x - 20^\circ) = \cos (3x - 10)^\circ$, then find the value of x .

Sol. $\sin (x - 20)^\circ = \cos (3x - 10)^\circ$

$$\Rightarrow \cos [90^\circ - (x - 20)^\circ] = \cos (3x - 10)^\circ$$

By comparing the coefficient

$$90^\circ - x^\circ + 20^\circ = 3x^\circ - 10^\circ \Rightarrow 110^\circ + 10^\circ = 3x^\circ + x^\circ$$

$$120^\circ = 4x^\circ \quad \Rightarrow \quad x^\circ = \frac{120^\circ}{4} = 30^\circ$$

Que 8. If $\sin^2 A = \frac{1}{2} \tan^2 45^\circ$, where A is an acute angle, then find the value of A .

$$\text{Sol. } \sin^2 A = \frac{1}{2} \tan^2 45^\circ \quad \Rightarrow \quad \sin^2 A = \frac{1}{2} (1)^2 \quad [\because \tan 45^\circ = 1]$$

$$\Rightarrow \sin^2 A = \frac{1}{2} \quad \Rightarrow \quad \sin A = \frac{1}{\sqrt{2}}$$

Hence, $\angle A = 45^\circ$

Short Answer Type Questions – II

[3 marks]

Que 1. If $\sin A = \frac{3}{4}$, calculate $\cos A$ and $\tan A$.

Fig. 10.3

Sol. Let us first draw a right $\triangle ABC$ in which $\angle C = 90^\circ$.

Now, we know that

$$\sin A = \frac{\text{perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AB} = \frac{3}{4}$$

Let $BC = 3k$ and $AB = 4k$, where k is a positive number.

Then, by Pythagoras Theorem, we have

$$\begin{aligned} AB^2 &= BC^2 + AC^2 & \Rightarrow (4k)^2 &= (3k)^2 + AC^2 \\ \Rightarrow 16k^2 - 9k^2 &= AC^2 & \Rightarrow 7k^2 &= AC^2 \end{aligned}$$

$$\therefore AC = \sqrt{7}k$$

$$\therefore \cos A = \frac{AC}{AB} = \frac{\sqrt{7}k}{4k} = \frac{\sqrt{7}}{4} \quad \text{and} \quad \tan A = \frac{BC}{AC} = \frac{3k}{\sqrt{7}k} = \frac{3}{\sqrt{7}}$$

Que 2. Given $15 \cot A = 8$, find $\sin A$ and $\sec A$.

Fig. 10.4

Sol. Let us first draw a right $\triangle ABC$, in which $\angle B = 90^\circ$.

Now, we have, $15 \cot A = 8$

$$\therefore \cot A = \frac{8}{15} = \frac{AB}{BC} = \frac{\text{Base}}{\text{Perpendicular}}$$

Let $AB = 8k$ and $BC = 15k$

Then, $AC = \sqrt{(AB)^2 + (BC)^2}$ (By Pythagoras Theorem)

$$= \sqrt{(8k)^2 + (15k)^2} = \sqrt{64k^2 + 225k^2} = \sqrt{289k^2} = 17k$$

$$\therefore \sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{15k}{17k} = \frac{15}{17}$$

$$\text{And, } \sec A = \frac{\text{Hypotenuse}}{\text{Base}} = \frac{AC}{AB} = \frac{17k}{8k} = \frac{17}{8}.$$

Que 3. In Fig. 10.5, find $\tan P - \cot R$.

Fig. 10.5

Sol. Using Pythagoras Theorem, we have

$$PR^2 = PQ^2 + QR^2$$

$$\Rightarrow (13)^2 = (12)^2 + QR^2$$

$$\Rightarrow 169 = 144 + QR^2$$

$$\Rightarrow QR^2 = 169 - 144 = 25 \quad \Rightarrow QR = 5 \text{ cm}$$

$$\text{Now, } \tan P = \frac{QR}{PQ} = \frac{5}{12} \quad \text{and } \cot R = \frac{QR}{PQ} = \frac{5}{12}$$

$$\therefore \tan P - \cot R = \frac{5}{12} - \frac{5}{12} = 0.$$

Que 4. If $\sin \theta + \cos \theta = \sqrt{3}$, then prove that $\tan \theta + \cot \theta = 1$.

Sol. $\sin \theta + \cos \theta = \sqrt{3}$

$$\Rightarrow (\sin \theta + \cos \theta)^2 = 3$$

$$\Rightarrow \sin^2 \theta + \cos^2 \theta + 2 \sin \theta \cos \theta = 3$$

$$\Rightarrow 2 \sin \theta \cos \theta = 2 \quad (\because \sin^2 \theta + \cos^2 \theta = 1)$$

$$\Rightarrow \sin \theta \cdot \cos \theta = 1 = \sin^2 \theta + \cos^2 \theta$$

$$\Rightarrow 1 = \frac{\sin^2 \theta + \cos^2 \theta}{\sin \theta \cos \theta}$$

$$\Rightarrow 1 = \tan \theta + \cot \theta$$

Therefore $\tan \theta + \cot \theta = 1$

Que 5. Prove that $\frac{1-\sin \theta}{1+\sin \theta} = (\sec \theta - \tan \theta)^2$

$$\begin{aligned} \text{Sol. LHS} &= \frac{1-\sin \theta}{1+\sin \theta} \\ &= \frac{1-\sin \theta}{1+\sin \theta} \times \frac{1-\sin \theta}{1-\sin \theta} \quad [\text{Rationalising the denominator}] \\ &= \frac{(1-\sin \theta)^2}{1-\sin^2 \theta} = \left(\frac{1-\sin \theta}{\cos \theta}\right)^2 = \left(\frac{1}{\cos \theta} - \frac{\sin \theta}{\cos \theta}\right)^2 \\ &= (\sec \theta - \tan \theta)^2 = \text{RHS} \end{aligned}$$

Without using tables, evaluate the following (6 to 10).

Que 6. $\frac{\sec^2 54^\circ - \cot^2 36^\circ}{\operatorname{cosec}^2 57^\circ - \tan^2 33^\circ} + 2 \sin^2 38^\circ \cdot \sec^2 52^\circ - \sin^2 45^\circ$.

$$\begin{aligned} \text{Sol. We have,} & \frac{\sec^2 54^\circ - \cot^2 36^\circ}{\operatorname{cosec}^2 57^\circ - \tan^2 33^\circ} + 2 \sin^2 38^\circ \cdot \sec^2 52^\circ - \sin^2 45^\circ \\ &= \frac{\sec^2 (90^\circ - 36^\circ) - \cot^2 36^\circ}{\operatorname{cosec}^2 (90^\circ - 33^\circ) - \tan^2 33^\circ} + 2 \sin^2 38^\circ \cdot \sec^2 (90^\circ - 38^\circ) - \sin^2 45^\circ \\ &= \frac{\operatorname{cosec}^2 36^\circ - \cot^2 36^\circ}{\sec^2 33^\circ - \tan^2 33^\circ} + 2 \sin^2 38^\circ \cdot \operatorname{cosec}^2 38^\circ - \left(\frac{1}{\sqrt{2}}\right)^2 \\ &= \frac{1}{1} + 2 \cdot 1 - \frac{1}{2} = 3 - \frac{1}{2} = \frac{5}{2} \end{aligned}$$

Que 7. $\frac{2 \sin 68^\circ}{\cos 22^\circ} - \frac{2 \cot 15^\circ}{5 \tan 75^\circ} - \frac{3 \tan 45^\circ \cdot \tan 20^\circ \cdot \tan 40^\circ \cdot \tan 50^\circ \cdot \tan 70^\circ}{5}$.

$$\begin{aligned} \text{Sol. We have} & \frac{2 \sin 68^\circ}{\cos 22^\circ} - \frac{2 \cot 15^\circ}{5 \tan 75^\circ} - \frac{3 \tan 45^\circ \cdot \tan 20^\circ \cdot \tan 40^\circ \cdot \tan 50^\circ \cdot \tan 70^\circ}{5} \\ &= \frac{2 \sin (90^\circ - 22^\circ)}{\cos 22^\circ} - \frac{2 \cot 15^\circ}{5 \tan (90^\circ - 15^\circ)} \\ & \quad - \frac{3 \tan 45^\circ \cdot \tan 20^\circ \cdot \tan 40^\circ \cdot \tan (90^\circ - 40^\circ) \cdot \tan (90^\circ - 20^\circ)}{5} \\ &= \frac{2 \cos 22^\circ}{\cos 22^\circ} - \frac{2 \cot 15^\circ}{5 \cot 15^\circ} - \frac{3 \tan 45^\circ \cdot \tan 20^\circ \cdot \tan 40^\circ \cdot \cot 40^\circ \cdot \cot 20^\circ}{5} \\ &= 2 - \frac{2}{5} - \frac{3 \tan 45^\circ \cdot (\tan 20^\circ \cdot \cot 20^\circ) \cdot (\tan 40^\circ \cdot \cot 40^\circ)}{5} \end{aligned}$$

$$2 - \frac{2}{5} - \frac{3}{5} \cdot 1 \cdot 1 \cdot 1 = 2 - \frac{2}{5} - \frac{3}{5} = 2 - 1 = 1.$$

Que 8. $\frac{\sin^2 20^\circ + \sin^2 70^\circ}{\cos^2 20^\circ + \cos^2 70^\circ} + \left[\frac{\sin(90^\circ - \theta) \sin \theta}{\tan \theta} + \frac{\cos(90^\circ - \theta) \cos \theta}{\cot \theta} \right].$

Sol. We have $\frac{\sin^2 20^\circ + \sin^2 70^\circ}{\cos^2 20^\circ + \cos^2 70^\circ} + \left[\frac{\sin(90^\circ - \theta) \sin \theta}{\tan \theta} + \frac{\cos(90^\circ - \theta) \cos \theta}{\cot \theta} \right]$

$$= \frac{\sin^2 20^\circ + \sin^2 (90^\circ - 20^\circ)}{\cos^2 20^\circ + \cos^2 (90^\circ - 20^\circ)} + \left[\frac{\cos \theta \sin \theta}{\tan \theta} + \frac{\cos \theta \sin \theta}{\cot \theta} \right]$$

$$= \frac{\sin^2 20^\circ + \cos^2 20^\circ}{\cos^2 20^\circ + \sin^2 20^\circ} + \left[\frac{\cos \theta \sin \theta}{\frac{\sin \theta}{\cos \theta}} + \frac{\cos \theta \sin \theta}{\frac{\cos \theta}{\sin \theta}} \right]$$

$$= \frac{1}{1} + [\cos^2 \theta + \sin^2 \theta] = 1 + 1 = 2.$$

Que 9. Evaluate $\sin 25^\circ \cos 65^\circ + \cos 25^\circ \sin 65^\circ$.

Sol. $\sin 25^\circ \cdot \cos 65^\circ + \cos 25^\circ \cdot \sin 65^\circ$

$$= \sin (90^\circ - 65^\circ) \cdot \cos 65^\circ + \cos (90^\circ - 65^\circ) \cdot \sin 65^\circ$$

$$= \cos 65^\circ \cdot \cos 65^\circ + \sin 65^\circ \cdot \sin 65^\circ$$

$$= \cos^2 65^\circ + \sin^2 65^\circ = 1.$$

Que 10. Without using tables, evaluate the following:

$$3 \cos 68^\circ \cdot \operatorname{cosec} 22^\circ - \frac{1}{2} \tan 43^\circ \cdot \tan 47^\circ \cdot \tan 12^\circ \cdot \tan 60^\circ \cdot \tan 78^\circ.$$

Sol. We have,

$$3 \cos 68^\circ \cdot \operatorname{cosec} 22^\circ - \frac{1}{2} \tan 43^\circ \cdot \tan 47^\circ \cdot \tan 12^\circ \cdot \tan 60^\circ \cdot \tan 78^\circ.$$

$$= 3 \cos (90^\circ - 22^\circ) \cdot \operatorname{cosec} 22^\circ - \frac{1}{2} \cdot \{\tan 43^\circ \cdot \tan (90^\circ - 43^\circ)\}$$

$$\quad \cdot \{\tan 12^\circ \cdot \tan (90^\circ - 12^\circ) \cdot \tan 60^\circ$$

$$= 3 \sin 22^\circ \cdot \operatorname{cosec} 22^\circ - \frac{1}{2} (\tan 43^\circ \cdot \cot 43^\circ) \cdot (\tan 12^\circ \cdot \cot 12^\circ) \cdot \tan 60^\circ$$

$$= 3 \times 1 - \frac{1}{2} \times 1 \times 1 \times \sqrt{3} = 3 - \frac{\sqrt{3}}{2} = \frac{6 - \sqrt{3}}{2}.$$

Que 11. If $\sin 3\theta = \cos(\theta - 6^\circ)$ where 3θ and $\theta - 6^\circ$ are both acute angles, find the value of θ .

Sol. According to question:

$$\sin 3\theta = \cos(\theta - 6^\circ)$$

$$\Rightarrow \cos(90^\circ - 3\theta) = \cos(\theta - 6^\circ) \quad [\because \cos(90^\circ - \theta) = \sin \theta]$$

$$\begin{aligned} \Rightarrow 90^\circ - 3\theta &= \theta - 6^\circ && \text{[comparing the angles]} \\ \Rightarrow 4\theta = 90^\circ + 6 &= 96^\circ &\Rightarrow \theta &= \frac{96}{4} = 24^\circ \end{aligned}$$

Hence, $\theta = 24^\circ$

Que 12. If $\sec \theta = x + \frac{1}{4x}$, prove that $\sec \theta + \tan \theta = 2x$ or $\frac{1}{2x}$.

Sol. Let $\sec \theta + \tan \theta = \lambda$...(i)

We know that, $\sec^2 \theta - \tan^2 \theta = 1$

$$\Rightarrow (\sec \theta + \tan \theta) (\sec \theta - \tan \theta) = 1 \quad \Rightarrow \lambda (\sec \theta - \tan \theta) = 1$$

$$\sec \theta - \tan \theta = \frac{1}{\lambda} \quad \dots\text{(ii)}$$

Adding equations (i) and (ii), we get

$$2 \sec \theta = \lambda + \frac{1}{\lambda} \quad \Rightarrow \quad 2 \left(x + \frac{1}{4x} \right) = \lambda + \frac{1}{\lambda}$$

$$\Rightarrow 2x + \frac{1}{2x} = \lambda + \frac{1}{\lambda}$$

On comparing, we get $\lambda = 2x$ or $\lambda = \frac{1}{2x}$

$$\Rightarrow \sec \theta + \tan \theta = 2x \text{ or } \frac{1}{2x}$$

Que 13. Find an acute angle θ , when $\frac{\cos \theta - \sin \theta}{\cos \theta + \sin \theta} = \frac{1 - \sqrt{3}}{1 + \sqrt{3}}$

Sol. We have,

$$\frac{\cos \theta - \sin \theta}{\cos \theta + \sin \theta} = \frac{1 - \sqrt{3}}{1 + \sqrt{3}} \quad \Rightarrow \quad \frac{\frac{\cos \theta - \sin \theta}{\cos \theta}}{\frac{\cos \theta + \sin \theta}{\cos \theta}} = \frac{1 - \sqrt{3}}{1 + \sqrt{3}}$$

[Dividing numerator & denominator of the LHS by $\cos \theta$]

$$\Rightarrow \frac{1 - \tan \theta}{1 + \tan \theta} = \frac{1 - \sqrt{3}}{1 + \sqrt{3}}$$

On comparing we get

$$\Rightarrow \tan \theta = \sqrt{3} \quad \Rightarrow \tan \theta = \tan 60^\circ \quad \Rightarrow \theta = 60^\circ$$

Que 14. The altitude AD of a ΔABC , in which $\angle A$ is an obtuse angle has length 10 cm. If $BD = 10$ cm and $CD = 10\sqrt{3}$ cm, determine $\angle A$.

Sol. ΔABD is a right triangle right angled at D, such that $AD = 10$ cm and $BD = 10$ cm.

Let $\angle BAD = \theta$

$$\therefore \tan \theta = \frac{BD}{AD} \quad \Rightarrow \tan \theta = \frac{10}{10} = 1$$

$$\Rightarrow \tan \theta = \tan 45^\circ \quad \Rightarrow \theta = \angle BAD = 45^\circ \quad \dots(i)$$

ΔACD is a right triangle right angled at D such that $AD = 10$ cm and $DC = 10\sqrt{3}$ cm.
Let $\angle CAD = \phi$

$$\therefore \tan \phi = \frac{CD}{AD} \quad \Rightarrow \tan \phi = \frac{10\sqrt{3}}{10} = \sqrt{3}$$

$$\Rightarrow \tan \phi = \tan 60^\circ \quad \Rightarrow \phi = \angle CAD = 60^\circ \quad \dots(ii)$$

From (i) & (ii), we have

$$\angle BAC = \angle BAD + \angle CAD = 45^\circ + 60^\circ = 105^\circ$$

Que 15. If $\operatorname{cosec} \theta = \frac{13}{12}$, evaluate $\frac{2 \sin \theta - 3 \cos \theta}{4 \sin \theta - 9 \cos \theta}$

Sol. Given $\operatorname{cosec} \theta = \frac{13}{12}$, then $\sin \theta = \frac{12}{13}$

$$\cos^2 \theta = 1 - \sin^2 \theta = 1 - \left(\frac{12}{13}\right)^2 = \frac{169-144}{169} = \frac{25}{169}$$

$$\cos \theta = \frac{5}{13}$$

Now,

$$\frac{2 \sin \theta - 3 \cos \theta}{4 \sin \theta - 9 \cos \theta} = \frac{2 \times \frac{12}{13} - 3 \times \frac{5}{13}}{4 \times \frac{12}{13} - 9 \times \frac{5}{13}} = \frac{24-15}{48-45} = \frac{9}{3} = 3$$

Long Answer Type Questions

[4 MARKS]

Que 1. In ΔPQR , right angled at Q, $PR + QR = 25$ cm and $PQ = 5$ cm. Determine the values of $\sin P$, $\cos P$ and $\tan P$.

Fig. 10.6

Sol. We have a right-angled ΔPQR in which $\angle Q = 90^\circ$.

Let $QR = x$ cm

Therefore, $PR = (25 - x)$ cm

By Pythagoras Theorem, we have

$$PR^2 = PQ^2 + QR^2$$

$$\Rightarrow (25 - x)^2 = 5^2 + x^2 \quad \Rightarrow (25 - x)^2 - x^2 = 5^2$$

$$\Rightarrow (25 - x - x)(25 - x + x) = 25$$

$$\Rightarrow (25 - 2x)25 = 25 \quad \Rightarrow 25 - 2x = 1$$

$$\Rightarrow 25 - 1 = 2x \quad \Rightarrow 24 = 2x$$

$$\therefore x = 12 \text{ cm.}$$

Hence, $QR = 12$ cm

$$PR (25 - x) \text{ cm} = 25 - 12 = 13 \text{ cm}$$

$$PQ = 5 \text{ cm}$$

$$\therefore \sin P = \frac{QR}{PR} = \frac{12}{13}, \quad \cos P = \frac{PQ}{PR} = \frac{5}{13}; \quad \tan P = \frac{QR}{PQ} = \frac{12}{5}$$

Que 2. In triangle ABC, right-angled at B, if $\tan A = \frac{1}{\sqrt{3}}$, find the value of:

(i) $\sin A \cos C + \cos A \sin C$

(ii) $\cos A \cos C - \sin A \sin C$.

Fig. 10.7

Sol. We have a right-angled $\triangle ABC$ in which $\angle B = 90^\circ$.

And, $\tan A = \frac{1}{\sqrt{3}}$

Now, $\tan A = \frac{1}{\sqrt{3}} = \frac{BC}{AB}$

Let $BC = k$ and $AB = \sqrt{3}k$

\therefore By Pythagoras Theorem, we have

$$AC^2 = AB^2 + BC^2$$

$$\Rightarrow AC^2 = (\sqrt{3}k)^2 + (k)^2 = 3k^2 + k^2$$

$$\Rightarrow AC^2 = 4k^2 \quad \therefore AC = 2k$$

Now, $\sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{k}{2k} = \frac{1}{2}$;

$$\cos A = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{\sqrt{3}k}{2k} = \frac{\sqrt{3}}{2}$$

$$\sin C = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{\sqrt{3}k}{2k} = \frac{\sqrt{3}}{2}$$

$$\cos C = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{k}{2k} = \frac{1}{2}$$

$$(i) \sin A \cdot \cos C + \cos A \cdot \sin C = \frac{1}{2} \times \frac{1}{2} + \frac{\sqrt{3}}{2} \times \frac{\sqrt{3}}{2} = \frac{1}{4} + \frac{3}{4} = \frac{4}{4} = 1.$$

$$(ii) \cos A \cdot \cos C - \sin A \cdot \sin C = \frac{\sqrt{3}}{2} \times \frac{1}{2} - \frac{1}{2} \times \frac{\sqrt{3}}{2} = \frac{\sqrt{3}}{4} - \frac{\sqrt{3}}{4} = 0.$$

Que 3. If $\cot \theta = \frac{7}{8}$, evaluate: (i) $\frac{(1+\sin \theta)(1-\sin \theta)}{(1+\cos \theta)(1-\cos \theta)}$, (ii) $\cot^2 \theta$.

Fig. 10.8

Sol. Let us draw a right triangle ABC in which $\angle B = 90^\circ$ and $\angle C = \theta$.

$$\text{We have, } \cot \theta = \frac{7}{8} = \frac{\text{Base}}{\text{Perpendicular}} = \frac{BC}{AB} \quad (\text{given})$$

Let $BC = 7k$ and $AB = 8k$

Therefore, by Pythagoras Theorem

$$AC^2 = AB^2 + BC^2 = (8k)^2 + (7k)^2 = 64k^2 + 49k^2$$

$$AC^2 = 113k^2 \quad \therefore AC = \sqrt{113}k$$

$$\therefore \sin \theta = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{8k}{\sqrt{113}k} = \frac{8}{\sqrt{113}}$$

$$\text{And } \cos \theta = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{7}{\sqrt{113}k} = \frac{7}{\sqrt{113}}$$

$$\begin{aligned} \text{(i)} \quad \frac{(1+\sin \theta)(1-\sin \theta)}{(1+\cos \theta)(1-\cos \theta)} &= \frac{1-\sin^2 \theta}{1-\cos^2 \theta} = \frac{1-\left(\frac{8}{\sqrt{113}}\right)^2}{1-\left(\frac{7}{\sqrt{113}}\right)^2} \\ &= \frac{1-\frac{64}{113}}{1-\frac{49}{113}} = \frac{\frac{113-64}{113}}{\frac{113-49}{113}} = \frac{49}{64} \end{aligned}$$

Alternate method:

$$\frac{(1+\sin \theta)(1-\sin \theta)}{(1+\cos \theta)(1-\cos \theta)} = \frac{1-\sin^2 \theta}{1-\cos^2 \theta} = \cot^2 \theta = \left(\frac{7}{8}\right)^2 = \frac{49}{64}$$

$$\text{(ii)} \quad \cot^2 \theta = \left(\frac{7}{8}\right)^2 = \frac{49}{64}$$

Que 4. If $3 \cot A = 4$, check whether $\frac{1-\tan^2 A}{1+\tan^2 A} = \cos^2 A - \sin^2 A$ or not.

Fig. 10.9

Sol. Let us consider a right triangle ABC in which $\angle B = 90^\circ$.

$$\text{Now, } \cot A = \frac{\text{Base}}{\text{Perpendicular}} = \frac{AB}{BC} = \frac{4}{3}$$

Let $AB = 4k$ and $BC = 3k$

\therefore By Pythagoras Theorem

$$AC^2 = AB^2 + BC^2$$

$$\begin{aligned}\Rightarrow AC^2 &= (4k)^2 + (3k)^2 = 16k^2 + 9k^2 \\ AC^2 &= 25k^2 \\ \therefore AC &= 5k\end{aligned}$$

Therefore, $\tan A = \frac{\text{Perpendicular}}{\text{Base}} = \frac{BC}{AB} = \frac{3k}{4k} = \frac{3}{4}$

And, $\sin A = \frac{\text{Perpendicular}}{\text{Hypotenuse}} = \frac{BC}{AC} = \frac{3k}{5k} = \frac{3}{5}$

$$\cos A = \frac{\text{Base}}{\text{Hypotenuse}} = \frac{AB}{AC} = \frac{4k}{5k} = \frac{4}{5}$$

Now, LHS = $\frac{1 - \tan^2 A}{1 + \tan^2 A}$

$$= \frac{1 - \left(\frac{3}{4}\right)^2}{1 + \left(\frac{3}{4}\right)^2} = \frac{1 - \frac{9}{16}}{1 + \frac{9}{16}} = \frac{16 - 9}{16 + 9} = \frac{7}{25}$$

$$\text{RHS} = \cos^2 A - \sin^2 A = \left(\frac{4}{5}\right)^2 - \left(\frac{3}{5}\right)^2 = \frac{16}{25} - \frac{9}{25} = \frac{7}{25}$$

Hence, $\frac{1 - \tan^2 A}{1 + \tan^2 A} = \cos^2 A - \sin^2 A$.

Que 5. Write all the other trigonometric ratios of $\angle A$ in terms of $\sec A$.

Sol. Let us consider a right-angled ΔABC , in which $\angle B = 90^\circ$.

For $\angle A$, we have

$$\text{Base} = AB, \text{ Perpendicular} = BC \quad \text{and} \quad \text{Hypotenuse} = AC$$

$$\therefore \sec A = \frac{\text{Hypotenuse}}{\text{Base}} = \frac{AC}{AB}$$

$$\Rightarrow \frac{\sec A}{1} = \frac{AC}{AB} \quad \Rightarrow \quad AC = AB \sec A$$

Let $AB = K$ and $AC = k \sec A$

\therefore By Pythagoras Theorem, we have

$$AC^2 = AB^2 + BC^2 \Rightarrow k^2 \sec^2 A = k^2 + BC^2$$

$$\therefore BC^2 = k^2 \sec^2 A - k^2 \Rightarrow BC = k\sqrt{\sec^2 A - 1}$$

$$\therefore \sin A = \frac{BC}{AC} = \frac{k\sqrt{\sec^2 A - 1}}{k \sec A} = \frac{\sqrt{\sec^2 A - 1}}{\sec A}$$

$$\cos A = \frac{AB}{AC} = \frac{k}{k \sec A} = \frac{1}{\sec A}$$

$$\tan A = \frac{BC}{AB} = \frac{k\sqrt{\sec^2 A - 1}}{k} = \sqrt{\sec^2 A - 1}$$

$$\cot A = \frac{1}{\tan A} = \frac{1}{\sqrt{\sec^2 A - 1}}$$

$$\operatorname{cosec} A = \frac{AC}{BC} = \frac{k \sec A}{k \sqrt{\sec^2 A - 1}} = \frac{\sec A}{\sqrt{\sec^2 A - 1}}$$

Que 6. Prove that: $\left(\frac{1+\tan^2 A}{1+\cot^2 A}\right) = \left(\frac{1-\tan A}{1-\cot A}\right)^2 = \tan^2 A$.

$$\text{Sol. LHS} = \left(\frac{1+\tan^2 A}{1+\cot^2 A}\right) = \frac{\sec^2 A}{\operatorname{cosec}^2 A}$$

$$= \frac{1}{\frac{\cos^2 A}{1}} = \frac{\sin^2 A}{\cos^2 A} = \tan^2 A$$

$$\begin{aligned} \text{RHS} &= \left(\frac{1-\tan A}{1-\cot A}\right)^2 = \left(\frac{1-\tan A}{1-\frac{1}{\tan A}}\right)^2 \\ &= \left(\frac{1-\tan A}{\frac{\tan A - 1}{\tan A}}\right)^2 = \left(\frac{1-\tan A}{\tan A - 1} \times \tan A\right)^2 = (-\tan A)^2 = \tan^2 A \end{aligned}$$

LHS = RHS.

Que 7. Prove that: $\tan^2 A - \tan^2 B = \frac{\cos^2 B - \cos^2 A}{\cos^2 B \cos^2 A} = \frac{\sin^2 A - \sin^2 B}{\cos^2 A \cos^2 B}$.

$$\text{Sol. LHS} = \tan^2 A - \tan^2 B = \frac{\sin^2 A}{\cos^2 A} - \frac{\sin^2 B}{\cos^2 B}$$

$$= \frac{\sin^2 A \cos^2 B - \cos^2 A \sin^2 B}{\cos^2 A \cos^2 B} = \frac{(1 - \cos^2 A) \cos^2 B - \cos^2 A (1 - \cos^2 B)}{\cos^2 A \cos^2 B}$$

$$= \frac{\cos^2 B - \cos^2 A \cos^2 B - \cos^2 A + \cos^2 A \cos^2 B}{\cos^2 A \cos^2 B} = \frac{\cos^2 B - \cos^2 A}{\cos^2 A \cos^2 B}$$

$$\text{Also } \frac{\cos^2 B - \cos^2 A}{\cos^2 A \cos^2 B} = \frac{(1 - \sin^2 B) - (1 - \sin^2 A)}{\cos^2 A \cos^2 B}$$

$$= \frac{\sin^2 A - \sin^2 B}{\cos^2 A \cos^2 B} = \text{RHS.}$$

HOTS (Higher Order Thinking Skills)

Que 1. Prove that: $\frac{\tan\theta}{1-\cot\theta} + \frac{\cot\theta}{1-\tan\theta} = 1 + \sec\theta \operatorname{cosec}\theta = 1 + \tan\theta + \cot\theta$.

$$\begin{aligned} \text{Sol. LHS} &= \frac{\tan\theta}{1-\cot\theta} + \frac{\cot\theta}{1-\tan\theta} = \frac{\frac{\sin\theta}{\cos\theta}}{1-\frac{\cos\theta}{\sin\theta}} + \frac{\frac{\cos\theta}{\sin\theta}}{1-\frac{\sin\theta}{\cos\theta}} \\ &= \frac{\sin\theta \times \sin\theta}{\cos\theta(\sin\theta - \cos\theta)} + \frac{\cos\theta}{\sin\theta} \times \frac{\cos\theta}{(\cos\theta - \sin\theta)} \\ &= \frac{\sin^2\theta}{\cos\theta(\sin\theta - \cos\theta)} + \frac{\cos^2\theta}{\sin\theta\{-(\sin\theta - \cos\theta)\}} \\ &= \frac{\sin^2\theta}{\cos\theta(\sin\theta - \cos\theta)} - \frac{\cos^2\theta}{\sin\theta(\sin\theta - \cos\theta)} = \frac{\sin^3\theta - \cos^3\theta}{\cos\theta(\sin\theta - \cos\theta)\sin\theta} \\ &= \frac{(\sin\theta - \cos\theta)(\sin^2\theta + \cos^2\theta + \sin\theta \cos\theta)}{\cos\theta \sin\theta (\sin\theta - \cos\theta)} = \frac{1 + \sin\theta \cos\theta}{\sin\theta \cos\theta} \\ &= \frac{1}{\sin\theta \cos\theta} + \frac{\sin\theta \cos\theta}{\sin\theta \cos\theta} = \frac{1}{\sin\theta} \cdot \frac{1}{\cos\theta} + 1 \quad \dots(i) \\ &= \sec\theta \operatorname{cosec}\theta + 1 \quad \dots(ii) \end{aligned}$$

For second part

Now from (i), we have

$$\begin{aligned} \text{LHS} &= \frac{1}{\sin\theta \cos\theta} + 1 \quad [\text{Putting } 1 = \sin^2\theta + \cos^2\theta] \\ &= \frac{\sin^2\theta + \cos^2\theta}{\sin\theta \cos\theta} + 1 = \frac{\sin^2\theta}{\sin\theta \cos\theta} + \frac{\cos^2\theta}{\cos\theta \sin\theta} + 1 \\ &= \frac{\sin\theta}{\cos\theta} + \frac{\cos\theta}{\sin\theta} + 1 = \tan\theta + \cot\theta + 1 \end{aligned}$$

Que 2. If $\tan A = n \tan B$ and $\sin A = m \sin B$, prove that $\cos^2 A = \frac{m^2 - 1}{n^2 - 1}$.

Sol. We have to find $\cos^2 A$ in terms of m and n . This means that the angle B is to be eliminated from the given relations.

Now, $\tan A = n \tan B$

$$\Rightarrow \tan B = \frac{1}{n} \tan A \quad \Rightarrow \quad \cot B = \frac{n}{\tan A}$$

And $\sin A = m \sin B$

$$\Rightarrow \sin B = \frac{1}{m} \sin A \quad \Rightarrow \quad \operatorname{cosec} B = \frac{m}{\sin A}$$

Substituting the value of $\cot B$ and $\operatorname{cosec} B$ in $\operatorname{cosec}^2 B - \cot^2 B = 1$, we get

$$\frac{m^2}{\sin^2 A} - \frac{n^2}{\tan^2 A} = 1 \quad \Rightarrow \quad \frac{m^2}{\sin^2 A} - \frac{n^2 \cos^2 A}{\sin^2 A} = 1$$

$$\begin{aligned} \Rightarrow \frac{m^2 - n^2 \cos^2 A}{\sin^2 A} &= 1 & \Rightarrow \frac{m^2}{\sin^2 A} - \frac{n^2 \cos^2 A}{\sin^2 A} &= 1 \\ \Rightarrow \frac{m^2 - n^2 \cos^2 A}{\sin^2 A} &= 1 & \Rightarrow m^2 - n^2 \cos^2 A &= \sin^2 A \\ \Rightarrow m^2 - n^2 \cos^2 A &= 1 - \cos^2 A & \Rightarrow m^2 - 1 &= n^2 \cos^2 A - \cos^2 A \\ \Rightarrow m^2 - 1 &= (n^2 - 1) \cos^2 A & \Rightarrow \frac{m^2 - 1}{n^2 - 1} &= \cos^2 A. \end{aligned}$$

Que 3. Prove the following identity, where the angle involved is acute angle for which the expressions are defined.

$$\frac{\cos A - \sin A + 1}{\cos A + \sin A - 1} = \operatorname{cosec} A + \cot A,$$

Using the identity $\operatorname{cosec}^2 A = 1 + \cot^2 A$.

$$\begin{aligned} \text{Sol. LHS} &= \frac{\cos A - \sin A + 1}{\cos A + \sin A - 1} = \frac{\sin A}{\frac{\cos A + \sin A - 1}{\sin A}} = \frac{\cot A - 1 + \operatorname{cosec} A}{\cot A + 1 - \operatorname{cosec} A} \\ &= \frac{(\cot A + \operatorname{cosec} A) - (\operatorname{cosec}^2 A - \cot^2 A)}{\cot A - \operatorname{cosec} A + 1} \quad [\because \operatorname{cosec}^2 A - \cot^2 A = 1] \\ &= \frac{(\cot A + \operatorname{cosec} A) - [(\operatorname{cosec} A + \cot A)(\operatorname{cosec} A - \cot A)]}{\cot A - \operatorname{cosec} A + 1} \\ &= \frac{(\operatorname{cosec} A + \cot A)(1 - \operatorname{cosec} A + \cot A)}{(\cot A - \operatorname{cosec} A + 1)} \\ &= \operatorname{cosec} A + \cot A = \text{RHS.} \end{aligned}$$

Que 4. If $x \sin^3 \theta + y \cos^3 \theta = \sin \theta \cos \theta$ and $\sin \theta = y \cos \theta$, prove $x^2 + y^2 = 1$.

$$\begin{aligned} \text{Sol. We have,} \quad x \sin^3 \theta + y \cos^3 \theta &= \sin \theta \cos \theta \\ \Rightarrow (x \sin \theta) \sin^2 \theta + (y \cos \theta) \cos^2 \theta &= \sin \theta \cos \theta \\ \Rightarrow x \sin \theta (\sin^2 \theta) + (x \sin \theta) \cos^2 \theta &= \sin \theta \cos \theta \quad [\because x \sin \theta = y \cos \theta] \\ \Rightarrow x \sin \theta (\sin^2 \theta + \cos^2 \theta) &= \sin \theta \cos \theta \\ \Rightarrow x \sin \theta &= \sin \theta \cos \theta \quad \Rightarrow x = \cos \theta \\ \text{Now, we have } x \sin \theta &= y \cos \theta \\ \Rightarrow \cos \theta \sin \theta &= y \cos \theta \quad [\because x = \cos \theta] \\ \Rightarrow y &= \sin \theta \\ \text{Hence, } x^2 + y^2 &= \cos^2 \theta + \sin^2 \theta = 1. \end{aligned}$$

Que 5. If $\tan \theta + \sin \theta = m$ and $\tan \theta - \sin \theta = n$, show that $(m^2 - n^2) = 4 \sqrt{mn}$.

Sol. we have given $\tan \theta + \sin \theta = m$, and $\tan \theta - \sin \theta = n$, then

$$\begin{aligned} \text{LHS} &= (m^2 - n^2) = (\tan \theta + \sin \theta)^2 - (\tan \theta - \sin \theta)^2 \\ &= \tan^2 \theta + \sin^2 \theta + 2 \tan \theta \sin \theta - \tan^2 \theta - \sin^2 \theta + 2 \tan \theta \sin \theta \\ &= 4 \tan \theta \sin \theta = 4 \sqrt{\tan^2 \theta \sin^2 \theta} \end{aligned}$$

$$= 4 \sqrt{\frac{\sin^2 \theta}{\cos^2 \theta} (1 - \cos^2 \theta)} = 4 \sqrt{\frac{\sin^2 \theta}{\cos^2 \theta} - \sin^2 \theta}$$

$$= 4 \sqrt{\tan^2 \theta - \sin^2 \theta} = 4 \sqrt{(\tan \theta - \sin \theta)(\tan \theta + \sin \theta)} = 4 \sqrt{mn} = RHS$$

Value Based Questions

Que 1. A circus artist is climbing from the ground along a rope stretched from the top of a vertical pole and tied at the ground. The height of the pole is 10 m and angle made by the top with ground level is 60° .

(i) Calculate the distance covered by the artist in climbing to the top of the pole.

(ii) Which mathematical concept is used in this problem?

(iii) What is its value?

Sol. (i) Clearly distance covered by the artist is equal to the length of the rope AC.

Let AB be the vertical pole of height 10 m.

It is given that $\angle ACB = 60^\circ$

Thus, in right angled $\triangle ABC$.

$$\sin 60^\circ = \frac{AB}{AC} \quad \Rightarrow \quad \frac{\sqrt{3}}{2} = \frac{10}{AC}$$

$$AC = \frac{10 \times 2}{\sqrt{3}} = \frac{20}{\sqrt{3}} = \frac{20\sqrt{3}}{3} \text{ m.}$$

Hence, distance covered by artist is $\frac{20\sqrt{3}}{3} \text{ m}$.

(ii) Trigonometric ratios of an acute angle of right angled triangle.

(iii) Single mindedness help us to gain success in life.

Que 2. A tree is broken by the wind. The top struck the ground at an angle of 45° and at a distance of 30 m from the root.

(i) Find whole height of the tree.

(ii) Which mathematical concept is used in this problem?

(iii) Which value is being emphasised here?

Fig. 6

Sol. (i) Let AB be the tree broken at C, such that the broken part CB takes the position CO and strikes the ground at O.

It is given that $OA = 30 \text{ m}$ and $\angle AOC = 45^\circ$

Let $AC = x$ and $CB = y$, then $CO = y$

In $\triangle OAC$, we have,

$$\tan 45^\circ = \frac{AC}{OA} \Rightarrow 1 = \frac{x}{30} \Rightarrow x = 30$$

Again in $\triangle OAC$, we have

$$\cos 45^\circ = \frac{OA}{OC} \Rightarrow \frac{1}{\sqrt{2}} = \frac{30}{y} \Rightarrow y = 30\sqrt{2}$$

Height of the tree = $(x + y)$

$$= 30 + 30\sqrt{2} = 30(1 + \sqrt{2})$$

$$= 30(1 + 1.414) = 30 \times 2.414 = 72.42 \text{ m}$$

(ii) Trigonometric ratios of an acute angle of right angled triangle.

(iii) Decreasing tree leads to deforestation which ultimately give birth to various problems.

Que 3. A person standing on the bank of a river observes that the angle of elevation of the top of a building of an organisation working for conservation of wild life, standing on the opposite bank is 60° . When he moves 40 metres away from the bank, he finds the angle of elevation to be 30° . Find the height of the building and the width of the river.

(a) Why do we need to conserve wild life?

(b) Suggest some steps that can be taken to conserve wild life.

Sol. Let AB be the building of height h metres standing on the bank of a river. Let C be the position of man standing on the opposite bank of the river such that $BC = x$ m. Let D be the new position of the man. It is given that $CD = 40$ m and the angles of elevation of the top of the building at C and D are 60° and 30° respectively, i.e., $\angle ACB = 60^\circ$ and $\angle ADB = 30^\circ$.

Fig. 7

In $\triangle ACB$, we have

$$\tan 60^\circ = \frac{AB}{BC} \Rightarrow \tan 60^\circ = \frac{h}{x}$$

$$\Rightarrow \sqrt{3} = \frac{h}{x} \Rightarrow x = \frac{h}{\sqrt{3}} \quad \dots(i)$$

In $\triangle ADB$, we have

$$\tan 30^\circ = \frac{AB}{BD} \Rightarrow \frac{1}{\sqrt{3}} = \frac{h}{x + 40}$$

$$\Rightarrow \sqrt{3}h = x + 40 \quad \dots(ii)$$

Substituting $x = \frac{h}{\sqrt{3}}$ in equation (ii), we get

$$\sqrt{3}h = \frac{h}{\sqrt{3}} + 40 \Rightarrow \sqrt{3}h - \frac{h}{\sqrt{3}} = 40$$

$$\Rightarrow \frac{3h-h}{\sqrt{3}} = 40 \Rightarrow \frac{2h}{\sqrt{3}} = 40$$

$$\Rightarrow h = \frac{40 \times \sqrt{3}}{2} \Rightarrow h = 20\sqrt{3} = 20 \times 1.732 = 34.64 \text{ m}$$

Substituting h in equation (i), we get $x = \frac{20\sqrt{3}}{\sqrt{3}} = 20 \text{ metres}$.

Hence, the height of the building is 34.64 m and width of the river is 20 m.

(a) Wild life is a part of our environment and conservation of each of its element is important for ecological balance.

(b) Ban on hunting, providing wild animals a healthy environment.

Que 4. The angle of elevation of the top of a chimney from the foot of a tower is 60° and the angle of depression of the foot of the chimney from the top of the tower is 30° . If the height of the tower is 40 m, find the height of the chimney. According to pollution control norms, the minimum height of a smoke emitting chimney should be 100 m. State if the height of the above mentioned chimney meets the pollution norms. What value is discussed in this question?

Sol. Let the height of the chimney AB be h . Height of tower $CD = 40 \text{ m}$.

The distance between the tower and chimney be d .

In $\triangle BCD$

$$\tan 30^\circ = \frac{CD}{BC}$$

$$\frac{1}{\sqrt{3}} = \frac{40}{d} \Rightarrow d = 40\sqrt{3}$$

In $\triangle ABC$

$$\tan 60^\circ = \frac{AB}{BC}$$

$$\sqrt{3} = \frac{h}{40\sqrt{3}} \Rightarrow h = 40\sqrt{3} \times \sqrt{3}$$

$$\Rightarrow h = 120 \text{ m}.$$

The height of the chimney is 120 m which is more than the minimum requirement to meet the pollution norms.

The values discussed here are:

- (i) Environmental awareness
- (ii) Social concern
- (iii) Abiding the laws.
