Solutions
Class 8 Maths
Chapter 5
Ex 5.2

Q.1: Given that the number $\overline{35a64}$ is divisible by 3, where a is a digit, what are the possible values of a.

Soln:

It is given that $\overline{35a64}$ is a multiple of 3. \therefore (3 + 5 + a + 6 + 4) is a multiple of 3.

 \therefore (a + 18) is a multiple of 3. \therefore (a + 18) = 0, 3, 6, 9, 12, 15, 18, 21...

But a is digit of number 35a64.

So, a can take value 0, 1, 2, 3, 4.... 9, a + 18 = 18

$$=> a = 0a + 18 = 21$$

$$=> a = 3a + 18 = 24$$

$$=> a = 6a + 18 = 27$$

$$\Rightarrow$$
 a = 9 : a = 0, 3, 6, 9.

Q.2: If x is a digit of the number $\overline{18 \times 17}$ is divisible by 3, find possible values of x.

Soln:

It is given that 18×71 is a multiple of 3.

(1 + 8 + x + 7 + 1) is a multiple of 3.

 \therefore (17 + x) is a multiple of 3.

$$\therefore$$
 17 + x = 0, 3, 6, 9, 12, 15, 18, 21 ... But x is a digit. So, x can take value 0, 1, 2, 3, 4 ... 9.

$$17 + x = 18$$

$$=>> x = 117 + x = 21$$

$$=>> x = 417 + x = 24$$

$$=>> x = 7x = 1, 4, 7$$

3.If x is a digit of the number 66784x such that it is divisible by 9, find possible values of x.

Soln:

It is given that 66784x is a multiple of 9.

$$\therefore$$
 (6+6+7+8+4+x) is a multiple of 9. And (31+x) is a multiple of 9.

Possible values of (31 + x) are 0, 9, 18, 27, 36, 45...

But x is a digit, so, x can only take value $0, 1, 2, 3, 4, \dots 9$.

$$\therefore 31 + x = 36$$

$$=> x = 36 - 31$$

$$=> x = 5$$

4. Given that the number 67y 19 is divisible by 9, where y is a digit, what are the possible values of y?

Soln:

it is given that 67y19 is a multiple of 9.

$$\therefore (6+7+y+1+9) \text{ is a multiple of } 9.$$

 \therefore (23 + y) is a multiple of 9. 23 + y = 0, 9, 18, 27, 36 ... But x is a digit. So, x can take values 0, 1, 2, 3, 4, ... 9. 23 + y = 27 => y = 4

5. If 3×2 is a multiple of 11, where x is a digit, what is the value of x?

Soln: Sum of the digits at odd places = 3 + 2 = 5

Sum of the digits at even places = x

 \therefore sum of the digits at even place – sum of the digits at odd places = (x - 5)

∴(x – 5) must be multiple by 11. ∴

Possible values of (x-5) are 0, 11, 22, 33 ... But x is a digit:

 \therefore x must be 0, 1, 2, 3, .. 9 \therefore x – 5 = 0 => x = 5

6.If 98215×2 is a number with x as its tens digit such that it is divisible by 4. Find all possible values of x

Soln: A natural number is divisible by 4 if the number formed by its digits in units and tens places in divisible by 4.

 $\therefore \overline{98215 \times 2}$ will be divisible by 4 if $\overline{x2}$ is divisible by 4.

 \therefore x2=10x + 2x is a digit; therefore possible values of x are 0, 1, 2, 3... 9.

x2 = 2, 12, 22, 32, 42, 52, 62, 72, 82, 92

The numbers that are divisible by 4 are 12, 32, 52, 72, 92. Therefore, the values of x are 1, 3, 5, 7, 9.

7. If x denotes the digit at hundreds place of the number $\overline{67 \times 19}$ such that the number is divisible by 11. Find all possible values of x

Soln: A number is divisible by 11, if the difference of the sum of its digits at odd places and the sum of its digits at even places is either 0 or a multiple of 11.

Sum of digits at odd places – sum of digits at even places – (6 + x + 9) – (7 + 1) = (15 + x) – 8 = x + 7

 $x + 7 = 11 \implies x = 4$

8. Find the remainder when 981547 is divided by 5. Do this without doing actual division.

Soln: If a natural number is divided by 5, it has the same remainder when its unit digit is divided by 5.

Here, the unit digit of 981547 is 7. When 7 is divided by 5, remainder is 2.

Therefore, remainder will be 2 when 981547 is divided by 5.

9. Find the remainder when 51439786 is divided by 3. Do this without performing actual division.

Soln:sum of the digits of the number 51439786 = 5 + 1 + 4 + 3 + 9 + 7 + 8 + 6 = 43.

The remainder of 51439786, when divided by 3, is the same as the remainder when the sum of the digits is divided by 3.

When 43 is divided by 3, the remainder is 1.

Therefore, when 51439786 is divided by 3, the remainder will be 1.

10. Find the remainder, without performing actual division, when 798 is divided by.

Soln: 798 = A multiple of 11 + (sum of its digits at odd places – sum of its digits at even places) 798

= A multiple of 11 + (7 + 8 - 9) 798

= A multiple of 11 + (15 - 9)798

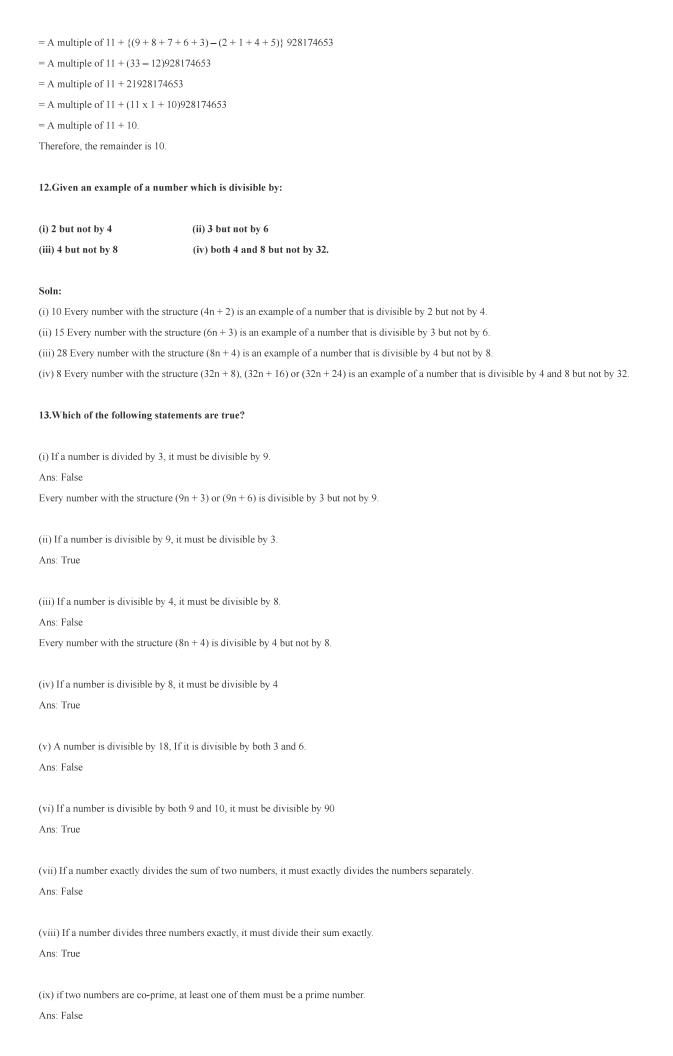

= A multiple of 11 + 6

Therefore, the remainder is 6.

11. Without performing actual division, find the remainder when 928174653 is divided by 11.

Soln:

928174653 = A multiple of 11 + (Sum of its digits at odd places – sum if its digits at even places) 928174653

(x) The sum of two consecutive odd numbers is always divisible by 4 $\,$ Ans: True
